4023. KPC-3 wiring for Radio Shack HTX 242

Yahoo group: APRS (2007 — 2010)
Date: 2007-01-02 02:57:51 UTC
From: Rod Rath
Topic: 4023 Message: 4023

Another Ham gave me a Kantronics KPC-3 and I need help wiring it to a Radio Shack HTX-242. I thought I had it right, but when I plug the cord into the radio only, it keys up the radio and un-keys very fast. This is before I plug it into the KPC-3. Any help would be great. Thank you.

Rod

4024. UI-View and MixW

Yahoo group: APRS (2007 — 2010)
Date: 2007-01-03 00:32:49 UTC
From: fire5man
Topic: 4024 Message: 4024

A while back when I first looked in to setting up something with APRS someone here helped me get a PC configured to run UI-View using my rig expert as a TNC and mixw as my software. At the time I did get everything working however the PC I had it set up on was my only one and I need to do other things with it (play games). However it was been replaced. I wiped out the hard drive and reinstalled only ham programs hoping no to tax it to much. Anyways I now cant get it back up and working. As of right now I have MixW up and running however set in packet mode I see the data in the waterfall being received but its not displaying anything in the text area. And as you most likely guessed nothing in UI-View.

Any help would be great.

Thanks,
Murray- KB3LZV

From: Mike Miller
Topic: 4024 Message: 4026

There is some info on this web page that describes MixW KISS TNC
emulation and mentions UI-View. Maybe it will help.
<http://mixw.net/related.htm>

I've never used MixW, so to me it would seem to be easier to use
AGWpe or Flex32 as the soundcard packet software as both are
supported by UI-View and are free.

From: zl1gbb
Topic: 4004 Message: 4027

Kurt
thanks for coming back on this. I have already read that
reference. Guess I didn't make myself clear. Look at this reference
line:
ZL1GBB-1>APU25N,WIDE1-1,WIDE3-3,qAo,ZL1GTB-1:=3809.27S/17615.57E-
Greetings from Rotorua, N.Z. {UIV32}

Notice the callsign after the qAo i.e. ZL1GTB-1. This is the callsign
of my local Igate station. It is not the server name. Compare that
with the line I have previously posted. There in the same position is
the server name T2NZAA.

My question is why does it not insert my callsign when I am sending
it data after I send a beacon?

The Q-constructs are intended to show the injection point into the
network of the packet, hence the igate callsign. They're also
intended to show how the packet got into the system (the letters
after the 'q'), to decrease the likelihood of routing loops through
the system, and to help in debugging the internet system.

4029. APRS Identification & QRM

Yahoo group: APRS (2007 — 2010)
Date: 2007-01-07 19:59:42 UTC
From: Michael N
Topic: 4029 Message: 4029

Hello to the group,

First of all I wish to say I know virtually nothing about APRS & Packet.
My interests lie elsewhere in amateur radio for the time
being, but perhaps I will look into it further when my plates
are not so full.

That being said, I submit the following, asking that the group
might comment:

I commute almost daily thru a small community monitoring 146.52
simplex. In about a 30-40 quare block area, I encounter QRM in
the form of either APRS or packet bursts.
The signal is relatively low in most areas, but more than plenty
to interfere with ongoing voice communications on that frequency.
I'm guessing it's either a low power device, or a mobile in a
parking garage or some other shielded area. It seems not to be
on the move.

My questions are:

How does an APRS or Packet station identify?
I hear no morse accompanying the transmissions.

Are automated stations sending these bursts not required by rule
to monitor a frequency for transmissions in progress and not cause
QRM to those transmissions?

If I were able to identify the station, I'd send a very polite
note letting him/her know that the automatic device is causing QRM on
the frequency.

I certainly cannot say that the bursts should not be there,
in that 146.52 is only a 2M phone calling frequency by gentlemen's
agreement. I merely have a problem with any station
not monitioring a frequency before transmitting, and causing QRM.

On a side note, this is being received on a new commercial mobile
radio with a very tight front end. It can also be received on my
Icom handheld. My point being, it is not an image or from an close
adjacent frequency.

many thanks, and much luck with your interests,

Michael KC7UPW

From: Jim Mastrogiovanni
Topic: 4029 Message: 4031

Michael,
This link shows all the APRS activity packets that
made it to findu.com within 50 miles of your listed
zip code. Scan the list and see if you know any of the
hams and ask them for help with identifying the signal
on 146.52. You will need some one with a packet
station. They possibly can then monitor and decode the
packet whish should have the station ID encoded in it.

APRS is by convention/agreement uses 144.390 mHz
simplex nation wide. Regular 2 Meter packet radio is
usuually found between 144.950 thru 145.090 mHz.

What Radio are you using?

I feel that you're hearing the QRM because of the front end on your radio - I have the same problem with my Icom706MKIIG.

My Icom 706MKIIG is a great radio however anytime I'm within 100 yards of my Packet Station I can distinctly hear the packets and I believe they are probably clear enough to for my TNC to decode.

Infact I might try that tonight.

I don't have that problem with other radios -
2 Icom 2100s, an Icom 2720, and a Yaesu ???? - the 2m FM only 55 or 60watt mobile radio.

They (or we) send their (our) callsign as part of the packet, like in
all packet radio.

Much gratitude to Jim, Ben and Jan for the "education".

In addition to visiting this group in the future for
more info, I'm planning on chatting with a few locals
using APRS at one of the local clubs.

Who knows? Perhaps I too will be on APRS and you'll
see me on one of the findu.com maps.

Oh, no! Another money pit.
Naw, it doesn't look too spendy to get on board.

thanks again and Happy 2007,
Michael KC7UPW

I have been using a Garmin eTrex Vista, but it doesn't use routing the
way you would like it, and it has a small display.
I think you'd consider using a GPSMAP for marine use, because those
have a serial connector (NMEA) and have larger displays than the
hand-helds.
The street maps can (AFAIK) be stored from the CDs to memory chips, if
they don't come on such chips.
I believe the GARMIN Street Atlas models now only come with USB ports,
and therefore won't communicate with your D7 NMEA GPS port.

(I now use my Vista with the radio, and separate GPS with larger
display for road navigation.)

Hi Kev,

I guessed you must have missed my note then:

I have a GARMIN Street Pilot Color Map available.

Comes with UK Metro Guide CD.
16MB blank cartridge
Cigarette lighter DC cable
PC serial interface cable - to attach to THD7.
All in original box.

Plus the combined DC and serial cable &
vehicle dash mounting.

All in first class working order.

?150:00

Cheers.

Dave.

4048. New to Group

Yahoo group: APRS (2007 — 2010)
Date: 2007-01-17 22:36:44 UTC
From: Art Marshall
Topic: 4048 Message: 4048

Hi there, I am new to the group and APRS, and have some questions.
I have an dual band HT and a mobile two meter radio. I have a KPC3+,
but no laptop computer. And by the way there is no laptop computer in
my future. I also do not have a GPS at this time.
Do I use a tracker,if so which one, with the HT or 2 meter radio.
Do I use my KPC3+ with my HT or 2 meter radio.
Which ever radio I use,what GPS should I be looking for.

Can you folks guide me in some direction.
tks, 73's, Art W1FJI

Probably several different directions at once, depending on what sort of responses you get!

Depending on which area you live in, the HT may not cut it. I live near a busy APRS area (Seattle) and an HT just won't do it for me. I run a mobile 2m radio dedicated to APRS and typically have it on medium power (probably 20W?).

If you roam very near a digipeater, don't have much in the way of obstructions, and the APRS frequency is pretty quiet, you might be able to get away with using an HT.

FWIW I run a 1/4 hole-mount antenna in the middle of my Jeep roof tied to a Kenwood TM-261A mobile rig, which is then connected to an OpenTracker-1 transmit-only TNC and to a DigiTraveler GPS. All of this plus my other 2-meter mobile rig are downstream from an APO2 switch: This turns off the radio equipment when the Jeep battery gets too a preset voltage, and turns it all on again a short time after I start the motor.

If you have a full-time internet connection you can get by at home with just the APRS software hooked to the internet feeds. This is assuming there's an igate in your area that can feed the APRS packets into the internet. If not, then you can hook up the KPC3+ to the computer and another radio (or scanner) to gate them yourself.

I wouldn't recommend running the KPC3+ as a mobile tracker because you'll then be running the very long NMEA strings over the air instead of the very short Mic-E or Base-91 strings that you could run if you used a TinyTrak or OpenTracker instead. TinyTraks or OpenTrackers are relatively inexpensive kits and would free up the KPC-3+ for more interesting uses like as a home unit or a digipeater.

Since you say there's no laptop in your future I'll just briefly mention that one advantage of allowing for the KPC3+ in the mobile rig sometimes is for two-way messaging and/or mapping of others on a laptop while mobile. If you had a laptop and would use it in this mode only sometimes, I'd recommend that you set up your cabling for the TNC's so that you could swap in the KPC3+ temporarily when you needed that mode, but use and OpenTracker the rest of the time.

As far as a GPS, you need a unit that has a serial port, not a USB port. There are are few out there that have both, but DON'T get one that only has USB! You may want a large display model that has street mapping, routing, and voice. You may want to use a handheld model or a "puck" style. There are lots of options. I happen to use a $30 puck model I got on closeout, but before that I used a Garmin 35 puck model. I've used a Garmin GPS-II+ as well (handheld, no maps). Almost anything which puts out NMEA on a serial port can be made to work for you, but sometimes the power/data cables for them can get expensive. For a mobile you don't want to be running anything on its internal batteries as it gets too expensive.

If you're after a puck model, consider a Deluo serial model or a Garmin 18. If you're after a mapping handheld or vehicle model, it comes down to user preference and fatness of pocketbook.

I couldn't find any specific information but I can't think of any radio that would NOT work with APRS. Since there is no PL, CTCSS with APRS that permits even the oldest of radios to work. As long as it can get to 149.390 and you can figure out how to interface into it, it will work...

Matt,
Are you sure? I don't see an I-gate anywhere near you. What is the
callsign of this digi/I-gate? Maybe it is currently off-line and you
are dependent on a much longer path to the APRS-IS.

Date: 2007-01-25 00:10:02 UTC
From: Rodney Kraft
Topic: 4056 Message: 4057

Does ANYONE have a diagram for the cable that connects the TM-271E to an MFJ-1270C?

I've tried to figure out the connections using both the TNC connection information (pin out) for the TM-271E Operators Manual and the MFJ-1270C Operators Manual, but they are rather confusing. They use different terminologies or abbreviations for their own pin outs.

The MFJ is actually understandable, but the TM-271E has abbreviations that don't coincide with the MFJ-1270C's pin out versions.

Thanks!

Yahoo group: APRS (2007 — 2010)
Date: 2007-01-25 20:26:20 UTC
From: Ken Burchfield
Topic: 4056 Message: 4060

This is not the information exactly, but perhaps it will help you work it out , to me the information on the radio side is much clearer. Good Luck
73 Ken
he PG-5A Cable pinout is as follows...[Note that the pinout at the bottom of the sheet is looking at the cable end, not the connector on the radio.]
The connector on the TM-G707A is set up as follows...
PIN 1 - PKD [Packet Data Input] - Audio output from TNC to TM-G707A
PIN 2 - GND
PIN 3 - PKS [Packet Data Standby] - Push To Talk
Pin 4 - PR9 - 9600 BPS Output from TM-G707A to TNC - 500mV p-p *
Pin 5 - PR1 - 1200 BPS Output from TM-G707A to TNC - 500mV p-p
Pin 6 - SQC [Squelch Control] - Open Squelch = 5V, Closed Squelch = 0V
* - Pin 4 is also 1200 BPS for use with dual-speed TNC's. Do not connect 4 and 5!
In our testing, we used our trusty PK-88 to see how the TM-G707A dealt with it. The cable configuration was easy to set up.
TM-G707A 6-PIN CONNECTOR
PK-88 1200 BPS TNC 8-PIN CONNECTOR
2 [RED]
1
1 [BROWN]
2
3 [ORANGE]
3
5 [GREEN]
8
Optional Squelch Pin 6 [BLUE]
Optional Squelch Pin 7
SHIELD [BRAID]
CONNECTOR OUTSIDE

Data performance was as good as we could have hoped, although we did not have the gear to test 9600 BPS available at the time of the review. One of the main factors affecting data performance is your antenna. You want to make sure that you have the best possible reception [strong S-Meter readings] when working packet.

Ken,

You may post this on the group also...

I am reading from the 1270C manual downloaded from the MFJ site and
from the TM271A/E manual. I use the RJ45 mic connector and a stereo
plug
connection for my station. I did purchase the PG-5A cable and it is
connected to my radio, but is not in use. There was another ham in the
area that did the same thing, but found the mic connection an easier
alternative, so this will be most of a second opinion, and by all means
if I decipher something wrong, please feel free to correct me.

Page 24 (page 15 of the hardcopy) of the pdf from MFJ
(http://www.mfjenterprises.com/man/pdf/MFJ-1270C.pdf)

These are TNC to serial connector on PC

Pin 1 is Frame ground
Pin 1 FG Frame Ground
Pin 2 TXD Transmit Data
Pin 3 RXD Receive Data
Pin 4 RTS Request To Send
Pin 5 CTS Clear To Send
Pin 6 DSR Data Set Ready
Pin 7 SG Signal Ground

Pin 8 DCD Data Carrier Detect
Pin 9 + 12V unregulated reference
Pin 10 - 12V unregulated reference

According to the IBM compatible section Pins 2,3, and 7 should be the only ones that need to be connected from the PC to the TNC.

I am guessing you have this part correct, as from the information you sent about the PG-5A cable...let's look at that..

This is what MFJ says are the pinouts for the TNC end:

Pin 1 Microphone audio, from the MFJ TNC to your transmitter.
Pin 2 Ground, audio and PTT common.
Pin 3 Push-to-talk, to allow the MFJ TNC to key your transmitter.
Pin 4 Receive audio, from your receiver to the MFJ TNC .
Pin 5 Squelch input (optional) to allow the MFJ TNC to detect activity on a
shared-mode channel.
Fig.3-1 TNC Radio Port Connector (<<<<they leave the pics out of course)

Comparing the PG-5A(TM271E) pinout to the MFJ 1270C pinout:

Pin 1 IS correct
Pin 2 IS correct (not used on RJ45)
Pin 3 IS correct
Pin 4 on the TNC should mate with Pin 5 on the radio IS correct
Pin 6 Cannot be verified. I am unable to find a voltage setting from the
TNC.

Looks like you have the wiring correct. Only one that cannot be verified
is the Squelch control, and without knowing the voltage sent from the TNC, not sure if this will work properly. They are both pins for squelch, so they should see each other properly, just not sure if the voltage will be correct.

Let me know how it comes out! Best of Luck!

Rodney Kraft <kc7cjo@...> wrote: Does ANYONE have a diagram for the cable that connects the TM-271E to an MFJ-1270C?

I've tried to figure out the connections using both the TNC connection information (pin out) for the TM-271E Operators Manual and the MFJ-1270C Operators Manual, but they are rather confusing. They use different terminologies or abbreviations for their own pin outs.

The MFJ is actually understandable, but the TM-271E has abbreviations that don't coincide with the MFJ-1270C's pin out versions.

Thanks!

We did extensive testing with APRSPoint on the new Vista OS, so far all functionalities worked with no problems. The usb/serial converter(IO Gear GUC232A) we used is also accepted by Vista using its XP driver. Vista seems to have good backward compatibility, and the interface looks nicer.

I built a stand alone weather station that was cheap and worked the
first time I plugged it in. But, it is a stand alone weather station,
not needing a computer to send it's data. Not sure if your're
interested in that or not-since you mentioned the computer software
you are running.

It's the uWeather by K0RX, and has an onboard RTC, a data logging
port (so it can be used in conjunction with a PC). The display unit
is optional, so a lagre amount of the expense and power consumption
can be avoided by leaving out the display. It's programmed with an rs-232 port.

It may or might not be what you wanted.

http://www.rxcomm.net/

Enjoy.

4066. aprspoint 4.0 available

Yahoo group: APRS (2007 — 2010)
Date: 2007-02-05 09:22:27 UTC
From: hxc98
Topic: 4066 Message: 4066

When you are tracking a moving object, aprspoint will record all its positions on the map, and optionally connect them with lines to form a track. If you are tracking multiple moving objects at the same time, the map could get cluttered quickly. In this new version, you can choose to selectively remove an individual object's track, or remove all tracks on the map. This version also includes fixes for several bugs reported by the users. We have also tested it extensively on the Vista platform as well. Old keys will no longer work on this new version, please refer to the web site http://www.aprspoint.com for upgrade details.

Hi there David,
I use the LaCrosse 7000 and while it doesnt have a display, its solar powered and totally wireless... I have the wind sensor up on my pole for my antenna and it seems to work fine.

I dont have it all connected up to APRS, so cant help you out, but there are plenty of cheap options.
Just look for stations that are easily maintained. (ie, you can change batteries without killing yourself) and also options between wireless and wired (i prefer wireless so not restricted to 10m). Also as the 7000 doesnt have a screen, the data logger collects all the information and will store a few hours of data for when the power goes out or whatever else goes wrong. some stations allow loggers, some dont. Some will only store small sets of data (as little as 10 minutes) so do you want it on constantly and being able to store ALL data, or just a general broad 'idea' of the conditions :)

more for you to think about...

sorry!! hehe

73s,
Chris

Please be careful with any LaCrosse weather station, make sure the parameters of humidity and temp fall under the category of your geographical location..

My stations bottom humidity parameter is 20%, I live in Phoenix Arizona, 5-15% is our summer average with 118F temps.

Due to the fact that the humidity is incorrect it throws off other scales. UI-View would report wrong. {Wind Chill, Dew Point..etc}

My station has met its demise due to the rough elements here in phoenix. The plastic components could not handle it. The anemometer was the first to go. Rain gauge still works I think, but is all cracked and broken. Many times it would error and fail during the hottest parts of the day.

If I find serious equipment that can handle this town with out costing serious cash I will replace my system.

That is how my old LaCrosse went. I think it was the 2310... I live in the Australian desert, so am guessing AZ is the same with hot dry winds and very little rain.

The station I have, you're right, only goes down to 10% humidity, (old one was 20-95) but the Davis stations are $2000. Alot of the time during summer we never make it as high as the 10 or 20 which is the bottom end of the humidity sensor.

Everyone says that if you want to do it properly, spend the money. The data ive been collecting for 3 years now is accurate enough for ME, but then, im not an official data collector.

The Davis station wont be too far away though. (hopefully)

Cheers,
Chris

I just bought a Lacrosse, then everybody started telling me how it wouldn't last long... One friend down in NM sent me a bunch of parts from his defunct Lacrosse station telling me I was going to _need_ them soon!

I've heard good things about Peet Bros. stations and Davis stations.

There are also the AAG stations which are cheaper and from what I hear more rugged than the Lacrosse ($80 from Mexico), but you'll have to add to them to get a bunch of sensors. I have the station the AAG station is a copy of, but it's not up yet. Mines a Dallas Semiconductor station that I got used for cheap. They have exactly three sensors initially: Outside temp, wind speed, and wind direction. They're very easy to add more sensors to though.

In my area the low-end of the humidity may not be a problem (near Seattle), and the UV killing the plastic might not be much of a problem either. My Lacrosse station may survive longer than those with them in the desert. From what I hear the Dallas/AAG station should outlast the Lacrosse wind sensor.

I can't answer whether one weather station brand is any better than any other. But, I think the humidity sensor in the K0RX roll your own weather station is a $35 dollar unit (Honeywell) and it does not measure below 20 percent relative humidity.

I think that all electronic sensors have this problem, I'd be surprised to find any high end weather station that did any better. To get below 20 percent you need a full sized conventional (mechanical) type sensor I think. To the best of my knowledge there is no such beast available for any price that is small, self contained, and non-mechanical (electronic, no moving parts).

If I lived in the desert or in a dry area that was routinely below 20 percent relative humidity, I don't think I'd really care whether the relative humidity was 8 percent or 14 percent. That's wicked dry (for humans anyway), and I'd probably want a humidifier in my house to bring the humidity up to a more comfortable 40 percent RH anyway.

I understand why someone living in the desert would want to know the RH though, and to plot it from season to season over the long term. I'm just not sure there is an electronic sensor solution at ANY price.

The humidity sensor for the AAG one-wire station also uses a
Honeywell sensor and the voltage out graphs show something like 0%
to 90 or 95% relative humidity. See the PDF linked to the page.

I stand corrected. I just found the full spec sheet I had on the Honeywell HIH-4000. It shows a linear response down to zero percent RH (on a graph). I don't know id that's due to the detector being linear or whether it has a rom lookup table to correct the output voltage so that it stays linear.

Enjoy-

It's possible that the A/D converter in the weather stations don't
read down to the low-end voltage the detector puts out. Poor or
just plain cheap design of the weather station perhaps.

I seem to remember that my Lacrosse doesn't read down to 0% or up to
100% humidity either. I don't know if they use the Honeywell sensor
though.

Topic: 4076 Message: 4076

Version 4.1 improved on the basis of 4.0. Added show/hide track in addition to track removal. Also, the color in which the mobile station names are displayed can be customized. And you can set up a tactical call sign, and choose to beacon it instead of youe regular call sign. In filter settings, you can choose to accept stations in the track list without manually adding them. This version has improved legacy TNC support as well.

Thanks, Michael KF6ZDM

4077. emergency beacon

From: John
Topic: 4077 Message: 4077

Dear Group,

I'm just completing 2 Micro trac 300s (packaged as pocket units) to use while hiking and thought that it might be useful for the secondary message to be some sort of SOS or Mayday. This message could be switched for example if a hiker needed medical evacutaion.

My question is, is there some standard protocol or message that will start a SAR? My guess is that some particular message will cause an alert somewhere. Or is the interaction only human based so a SOS or MAYDAY might be enough.

Since I haven't seen this addressed anywhere, I'm putting it to the group. Thanks in advance.

AFAIK, any message in the amateur radio system will be interpreted by
a person before any action is taken.
In my experience, a Emergency status text from a Kenwood D7 / D700
will cause a reaction in other D7 / D700 stations, but I haven't been
trying for quite some time.

This probably isn't discussed often enough.

In the Mic-E protocol are bits that define EMERGENCY, so that is one method of doing it. Most APRS clients will alert the operator and center the map on that station when a Mic-E emergency packet is received.

Another method is used by Xastir and APRS+SA since those two applications don't implement other protocols besides Mic-E protocol. Put any of these keywords in the comment field of the packet, in upper-case:

EMERGENCY
ALARM
ALERT
WARNING
WXALARM
EM

APRSWorld.net also implements alerts based on receiving "EMERGENCY" in a packet. Users can subscribe to e-mail alerts which depend on that condition plus the emergency station being within XX miles.

It depends on the hardware, or the software program. You can key in
a message from a TH-D7/TM-D700/HamHUD directly on the hardware.

If you're not running that class of hardware, but have an
application running, you can invoke the "Send Message" function
from your software on your laptop/desktop/PDA.

Paul,

You do it by using an APRS client software (see
<http://info.aprs.net/wikka.php?wakka=Software>) or
a radio that has the capability such as a Kenwood D7 HT or D700 mobile.

Ron,

I am running UIview iGate and have tried to send a message (from the message menu selection) to a station with call sign but it does not show up in the msg column for that station. Is there something else I need to do? I had others send messages for my tracker OK and it shows up there.

Is the station a local one that is in RF range? If so then "Port" in the message window should be
the port that your TNC is on. In this case the message will not be sent to the APRS-IS system and
therefor will not show in Findu. If the station is not local then "Port" should be set to I and the
message should then show in Findu.

In APRS Server Setup make sure "Gate local messages" is checked. On my system I have all three
items in that section checked.

4085. APRSPOINT and Streets adn Trips 2007 - problems

Yahoo group: APRS (2007 — 2010)
Date: 2007-02-10 14:33:08 UTC
From: Don Shelton
Topic: 4085 Message: 4085

When I installed Streets and Trips 2007, APRSPOINT stopped working.
(error message says element not found...)

Uninstalling ST 2007 does not help. Reinstall MapPoint 2004 w/o ST
2007 does not help. Multiple reloads of APRSPOINT 3.2 or 4.1 does not
correct the problem.

I had to replace my hard drive and I had an image from before ST 2007
was installed, so I had the chance to do a controlled experiment.
Simply installing ST 2007 hosed things again.

Anyone else having this problem, or do you have a fix?

Tnx

don

another group. THANKS! don K5OK

---------- begin repost ----------

Posted by: "AE5PL Lists" HamLists@... ae5pl
Sat Feb 10, 2007 11:28 am (PST)
You left out an important piece: What element doe the error message
say
is not found? Quite often, different mapping software can cause
certain
controls to become unregistered. Specifically, I have found that
certain Microsoft products can deregister the MapPoint ActiveX
control.
The good news is this is easily remedied:

Open a command window (Run... cmd). Be sure to run cmd and not
command.
cmd is the Windows NT/2000/2003/XP/Vista command shell. command is an
attempt at DOS compatibility and should not normally be used in the
newer operating systems.

At the command prompt, cd (change directory) to the directory where
MapPoint was installed (normally C:\Program Files\Microsoft MapPoint).
If it is in the default directory you would enter:
cd "C:\Program Files\Microsoft MapPoint"
now enter:
regsvr32 MappointControl.ocx
You should get a popup message after a few seconds saying the control
was successfully registered. At this point, APRSPoint should work
fine.

For UI-View?
Try <http://f5vag.eu/php/file_download_filter_txt.php>

>I used to connect to uk.aprs-uk.net:10153 but I get the message
>"forcefully rejected"!!!
>
>Ideally I am looking for a UK filtered list to connect to.

It doesn't matter which server you use if you use a server using port
14580. Then, you'll have to define your own filter. On f5vag's page
there is a link to a filter description, and (assuming you are using
UI-View) the help on the Setup - APRS Server Setup will also give you
good advice.
I am using uiview.aprs2.net:14580 and 3 other servers, and a filter
limiting to stations up to 500 km from my own position.

4093. APRS Digipeater

Yahoo group: APRS (2007 — 2010)
Date: 2007-02-16 02:14:09 UTC
From: exkal_work
Topic: 4093 Message: 4093

Hi gang;

I've been out of the APRS "game" for quite a long time.

There is a serious lack of a good wide-coverage (and reliable) digi-
peater where I live (Toronto, Ontario Canada). Anyways... I'm some
30 floors up and have an un-restricted view of most of the city and
surrounding area...RF wise, I can talk to anything simplex within
20km or so, if not more. So, I'm wanting to setup a digipeater to
serve the area.

Anyway, what I have that I can dedicate to this project:

- Motorola Radius 45W mobile (VHF)
- MFJ-1270C TNC
- Sinclair 3db commercial antenna
- Pentium 3 600MHz PC

I've used the Motorola radio on packet numerous times in the past and
it works great, so there shouldn't be any issues.

My question is... what would you guys recommend I use for software to
put this thing on the air?

Thanks very much!

-Mike

4094. Special Paths

Yahoo group: APRS (2007 — 2010)
Date: 2007-02-16 02:15:51 UTC
From: Bryan
Topic: 4094 Message: 4094

I am interested in knowing if there are any special path names for special situations, such as:

1. Local reception only -- ie. no digipeater hops (for close range operations when no digi needed or desired, or so I know they are likely within simplex range)

2. Direct to any local digi with APRS-IS Gate and no further digirepeat (basically a local only packet that still makes it to FINDU if a gate is available, if not it is not repeated).

3. Digipeat normally (like WIDE1-1,WIDE2-1), unless it can be gated to the internet and in that case do not repeat packet or continue the path.

I think these 3 scenarios would be helpful in heavily populated areas. A lot of times I don't need or want a lot of hops tying up the frequency. All I want is my packet to go to local stations and/or to FINDU.

Maybe there are special path names someone knows or special ways of crafting paths to accomplish these goals???

Thanks,
Bryan

Use only "NOGATE" or "RFONLY" as the path. No digipeater will touch
it plus all igates are supposed to ignore it. It should stay as
local RF and simplex range only.

> 2. Direct to any local digi with APRS-IS Gate and no further
> digirepeat (basically a local only packet that still makes it to FINDU
> if a gate is available, if not it is not repeated).

This is for your home station? If you have an Igate nearby, then
you'd probably send it to "WIDE2-1", which will give it one digipeat
hop by a moutaintop and not trigger the home fill-in digi's. If the
igate is further away you might go to "WIDE2-2" instead.

If you're mobile, then change the above to "WIDE2-1" or
"WIDE1-1,WIDE2-1". I suppose you could go just "WIDE1-1" instead in
that case as well, which will trigger one hop via home fill-in
digi's -or- mountaintop digis.

> 3. Digipeat normally (like WIDE1-1,WIDE2-1), unless it can be gated to
> the internet and in that case do not repeat packet or continue the path.

You specified a good mobile path. For a house use WIDE2-2 instead
unless you have troubles getting into a mountaintop. There are no
paths that can do an either/or thing like you describe in #3. In
other words, no intelligent routing.

> I think these 3 scenarios would be helpful in heavily populated areas.
> A lot of times I don't need or want a lot of hops tying up the
> frequency. All I want is my packet to go to local stations and/or to
> FINDU.
>
> Maybe there are special path names someone knows or special ways of
> crafting paths to accomplish these goals???

If from your house you can always specify the digipeater(s)
callsign(s) directly instead of using generic calls like I describe
above. This will limit the "flooding" protocol and send you packet
in only one direction. Some people are ringed by mountaintop

digi's, and this will reduce the number of packets at the expense of making your path more susceptible to single-point-of-failure problems (that digi going down will take you out unless you recognize the fact and change your path).

4098. aprspoint 4.2 available

Yahoo group: APRS (2007 — 2010)
Date: 2007-02-16 16:21:13 UTC
From: hxc98
Topic: 4098 Message: 4098

APRSPoint 4.2 is uploaded to http://www.aprspoint.com/

1. This new version has improved tracking support by adding separate track lists for stations to be tracked over either RF or TCP link.

2.It also added a new reject field in the filter dialog, where you can specify a list of stations to filter out using multiple strings that can contain wild card characters.

3. It allows you to selectively remove stations from the tree view list. This combined with improved filter operation, enables you to dynamically adjust what gets displayed on the map.

Please visit http://www.aprspoint.com for details and download.

Thanks, Michael KF6ZDM

Hello:

I presently run APRS 24/7 as an Igate here in NW TN. I am contemplating setting up as a TelPac gateway for the Winlink system. I understand that APRS can be combined with this function. Does anyone have experience doing this ? What are pros / cons. I may not do this 24/7 but just interested in incorporating Winlink into the EmComm setup here. There are very few TelPac nodes around - the nearest about 65 miles away.

Thanks and 73,

Jamie

Our club set up a system doing exactly what you are asking about in 2006. Check out the APRS-IS data for W5SI-2 and W5SI-WL. The system has been operating 24/7 in the NE quadrant of Houston but we are still "tweaking" now and then to improve operations. Send me an -email direct (check QRZ for address) and I will provide additional details and pictures.

Mike:

If you have full time Internet I'd suggest also running UI-View but operate it as an Igate also. With that kind of coverage you could Igate traffic, and provide a single hop for the area.

I'd also suggest dropping the power on the mobile when you program it up. I run a bunch of digi's & Igates from high sites in Colorado and keep all of them at 20 watts or less. It improves the odds of mobiles getting into adjacent digis. A lot of power out of the digi just improves the odds of wiping out traffic on nearby digis. I've one digi that is only a 5 watt portable on a solar site that is routinely heard on a digi over 100 miles away.

APRS is used for special events as well.
Maybe you don't need to have the entire world know
where your local
marathon lead runner, tail runner, and the med vans
are.

On something like that you can use a different RF
channel, but there are
still a lot of crystal controlled trackers out there.
And with units like the
Tiny Track 3 offering two different configurations and
selecting the path
by flipping a switch then having a local-only path
option is very handy.

Sometimes you might also want to run a very high rate on a tracker
or two but not trash the nearby heavy-use areas. These are usually
special events.

I live in a foothill area of Los Angeles where I am too close and overlooked by the local high-level digis. There are apparently no home stations in the area that respond to WIDE1-1. A friend who runs the W6SCE-10 digi discouraged me from putting up a public digi to avoid congesting the channel. What path do I use to (attempt to) digi first through my own home station and still be able to use public digis when away from the area? Pretend the home station is K6GKA-10 (I bought a KPC3+ but have yet to fire it up). TIA.

4110. Weather Stations and APRS

Yahoo group: APRS (2007 — 2010)
Date: 2007-02-20 02:31:43 UTC
From: Matt
Topic: 4110 Message: 4110

I'm wanting to send my weather station's data over APRS, but I don't want to buy Weather Display or some type of weather station software because I won't need it. Does anyone know of any way at all to take a weather stations data and send it over APRS without buying a fancy program to organize into the file format needed? I own the Oregon Scientific WMR-968.

Matt, WX4MET

4111. Re: [APRS] Weather Stations and APRS

Topic: 4110 Message: 4111

Matt,

Someone asked about this recently on this list, and I pointed out that one could use the K0RX self contained weather station, no computer needed, no tnc needed, all the sensors are mounted on the PCB and it includes provisions for a 1 wire wind speed indicator. The board produces clean audio with is sent directly to your FM rig. You calibrate the sensors with an rs-232 connection to your PC.

It can be used with a display (it's an option), but it's not needed.

It also has a datalogging port with an onboard clock, so aftermarket dataloggers can be connected.

4112. Help!! KAM + V8.2 PEBKAC Error

Yahoo group: APRS (2007 — 2010)
Date: 2007-02-20 12:17:42 UTC
From: kf8zn
Topic: 4112 Message: 4112

First off PEBKAC stands for Problem Exists Between Keyboard And Chair,which I readily admit here!

Below is a summary:

The KAM plus "talks" to the computer and radio using Kantronics Pacterm, and I am receiving APRS packets legibly, with some garbage I attribute as being the APRS icons, etc. So I am receiving legible position data and tags such as "W9XXX mobilinig around", AND the TNC will transmit packets I can monitor, as in I type in the command, in pacterm "connect WA4XXX-1" , where wa4XXX is typed in just for test, and the radio sends out packet squawks I have monitored on my scanner. The problem is: I am having no luck getting Win APRS to communicate with the KAM PLUS. So I am sure it is operator error at some level, as the TNC is working, and the radio hookup is transceiving using PACTERM. I know version 8.2 of the kam+ firmware is capable of APRS, but I have only the basic manuals for the kam+, and no documentation on firmware 8.2.

I haven't run packet in 10 years, and never APRS.

You don't mention what OS you're running. Xastir has support for
the WMR-968 via the wx200d daemon, see:

Hi all
Ham that runs the local igate and digipeater just went on holiday.
Closed the station down and wont be back a while. Lots of lonely little
stations and trackers sounding off mournfully with NO digi or igate to
send them on. But my question is this. None of them show up on my map.
I can hear them on the speaker of the radio but nothing on the station
list or monitor. How come?

I believe you answered your own question. If the IGate and digipeater
are shut down, then nothing's coming in or going out.

Maybe you ought to put up your own IGate? :-)

Maybe the radio side of your system has never worked, and you've only been getting stations from the Internet...

Also, it's possible for the signal to be audible but too noisy to decode.

From: Matt - WX4MET
Topic: 4115 Message: 4118

Maybe he's experiencing something I do, too. When I have my receiver connected and AGWPE running, it doesn't display stations heard direct, but instead whatever stations the local digipeater retransmits. If I turn down the audio so that there is none going into the computer and I listen on another receiver, I can hear the packets being sent and nothing is displayed. Really, I want UI-View to display only those stations I receive directly, not what comes through the digipeater. I'm guess this has something to do with my path settings? Matt, WX4MET --If my people, which are called by my name, shall humble themselves, and pray, and seek my face, and turn from their wicked ways; then will I hear from heaven, and will forgive their sin, and will heal their land. Trying to concurrently learn the basics of both ubuntu and Xastir is proving to be quite a challenge.

I've succeeded in establishing a connection to a server, and my station shows up in UI-View on a Windows machine My filter is "r/39/076/100" (without the quotes, of course). I don't see any nearby stations (Ui-View does), and there is nothing showing when I view the "last stations"panel.

What did I miss?

Thanks for any help.

Did you enter your callpass number in the properties dialog for your
internet interface? Without it you'll not authenticate to the
server and therefore not get any packets.

Try just "m/500" first, and make sure you don't enter the word "filter" on the line (Xastir adds that internally). This should help make sure the filter itself isn't to blame. I'm not good on filter strings, having to resort to the online docs each time I need to change them, so I can't tell you whether your filter string is correct.

Also, as I previously stated, make sure you enter a valid passcode for that interface.

Callpass number? Aha! That did it.

Now, do I dare ask if there's something in/for Xastir equivalent to the UI-Weather add-in which highlights weather warnings, etc.?

What a sweet program!

Thanks for getting me over a hump.

Bill

Did you enter your callpass number in the properties dialog for your internet interface? Without it you'll not authenticate to the server and therefore not get any packets.

Yea. We don't use add-ons though, it's all built-in. See the
xastir/scripts directory, "get-NWSdata" script. Run it as the
"root" user and it'll snag the NOAA weather alert maps and install
them into "/usr/local/share/xastir/Counties". That should be the
proper location unless you've added configure flags to change where
Xastir gets installed, or are running the Linux Standard Base (LSB)
binary version of Xastir.

I deal with the sources all the time, so for me they're in
~/src/xastir/scripts. ;-)

Try /usr/local/lib/xastir, which is the install location for _most_
of the Xastir scripts. Some of the scripts don't get installed as
they're only useful for development and have no use in a binary
install.

4128. W4ACS-10 Digi Callsign Changed to W4ACS-11

Yahoo group: APRS (2007 — 2010)
Date: 2007-02-27 14:48:44 UTC
From: Neil Lauritsen
Topic: 4128 Message: 4128

I have changed the callsign of the Clearwater APRS Wide area APRS Digipeater from W4ACS-10 to W4ACS-11 to accommodate the use of the W4ACS-10 callsign for the new Clearwater FPACK switch. The callsign of the switch will then be W4ACS-10 as the -10 ssid is the default for the switches.
If you have been using wide2-2 you will not see a difference (You should be using that in your setups)
If for some reason you have been specifying W4ACS-10 please change it to W4ACS-1. Thanks.

73,

Neil

No idea. Most of the various binary packages are done by
non-Xastir-developers. Let's put it another way... The only binary
packages I can think of that are done by developers are the
LSB-binary and the SuSE RPM's, both done by me. We don't want to
get into the mode of trying to keep an up-to-date package for each
and every possible OS we run on out there, so we expect either
advanced users to do this, or for people to install from sources.
An alternative for Linux users is to use the LSB-binary.

You can look in the latest development snapshot on sourceforge or
snag the script from CVS. http://sourceforge.net/projects/xastir

Hi, Curt:

I tossed out the Ubuntu package, followed the instructions in
http://www.xastir.org/wiki/index.php/Install_Guide, and actually got V1.8.5
up and running. Then I found the script you mentioned and ran that. Now I
have 20-some files in the Counties folder, so I guess that went ok. Won't
know whether the deed is done until we get a watch or warning, I guess.

I've got the Online/USRadar.geo map loaded, but don't see the radar overlay.

Thanks for your patient guidance.

Bill

There's a test file you can suck in, NWS-TEST.log, which will light
up all kinds of warnings in OR/ID/WA and into the Pacific a bit. To
use it you may have to edit the DAY 2-digit field on each line so
that the day is AFTER the current date (into the future) but less
than 15 days ahead or so. In other words you could change it to 05
or something.

> I've got the Online/USRadar.geo map loaded, but don't see the radar overlay.

Try WMSRadar.geo

From: James C. Hall MD
Topic: 4132 Message: 4132

Hello:

I've been following the Xastir thread, I've got UI-NWS runing on my old APRS setup - UI-View with PMap 5 and Precision Mapping 5. It works great and I see the counties under a watch or warning light up either yellow or red with boxes defining these areas. The idea of also having the radar images on the display is fascinating. I'm looking into NWSGet but it looks like I have to upgrade at least the PServer to 7 - and maybe the Precision Maps.

Any trouble upgrading the PServer from 5 to 7 by just overinstalling? Any advise would be appreciated.

From: David
Topic: 4134 Message: 4134

Folks,

I am using the APRS Google Earth Data Server (Java) and this is my first time using the APRS-IS servers. I have a fairly long budlist and I can't see why I am only recieving a couple of them, certainly after a couple of hours, I should see more of them.

Next question; are symbols and budlists mutually exclusive, I am also using -b/CW* to filter CW stations. Where I am going with this is ... I want to see all my budlist, and I want to watch certain symbols, in other words budlist regardless of symbol type since I would also be filtering symbols like house and car.

I'm new to this so any pointers would be greatly appreciated.

Yes, the X-DIGI/TNC-X works very well for an APRS digi. I have tried it, works well, supports the new protocol. You can even get questions answered. And the nice thing, there is no backup battery to run down, so you could have a forever digi.

I have used my PK-232 with UI-View. Open Comms Setup under the setup tab. Set the Baud/Data/Stop/Parity to match how your 232 is set. Select RTS/CTS handshaking, NONE for Host Mode
PK-232 for TNC type. Select the correct com port and click OK. Note that when used this way I am
NOT using it as a digipeater.

How accurate do you want?!!!

dd.mm.mm (it's decimal minutes in UI-View) is accurate to about 1 foot -
way, way more accurate than a GPS.

There are many different APRS applications out there, it depends on your
specific application as to the one that would best suit.

Actually, I think hundredths of a minute only gets you to about 60 feet.

Earth circumference (at equator) = 24902 miles or 131482560 feet,
365229 feet per degree,
6087 feet per minute

That's the standard APRS format, so it's not a limitation in UI-View.
However, Base91 will get down to a foot or so resolution. I'm not sure if
UI-View has an option to send positions in that format.

Scott

No, I should say :-)

>I can put in coordinates in dd.mm.ss but they're not precise enough. :)

But you shouldn't enter the coordinates in that format.
Use degrees.minutes.decimals of minutes (as described in UI-View's
help), e.g. 45.45.50 (fortyfive and a half minutes) for 45?45'30".
Remember 3 digits for longitudal degrees.

They will be precise enough if you use that format, and have maps in
cylindric projection and correct corner coordinates, provided the map
details are precise as well.

I would answer differently, but then I'm probably biased. ;-)

For better precision than standard APRS packets or Mic-E packets (which each give about 40' x 60' precision at my latitude) then use Xastir with Base-91 compression. Perhaps use Opentracker units in the vehicles or on foot, again with Base-91 compressed packets.

Base-91 compression is in the standard APRS specification, but not all of the hardware or software out there supports it. Base91 will give you about 2' precision. This means it is better precision than your GPS accuracy is capable of, so at least you don't lose anything in translation over the airwaves.

Zoom way in with one of the later Xastir versions and you'll see a white rectangle around the station. This rectangle changes size based on the precision being transmitted by that station so you can visualize how precise each station's packets are.

4145. Pakratt 232

Yahoo group: APRS (2007 — 2010)
Date: 2007-03-03 17:23:39 UTC
From: ve5bjm
Topic: 4145 Message: 4145

Would like to hear about anyone's experience setting up the Pakratt 232
as a stand alone digipeater?

Help with the Unproto command and the digipeating.

Thanks
Brian

Here's a good place to start:

<http://info.aprs.net>

Which operating system are you running on your computer? That will
determine which APRS programs you may want to try. Here's a list:

<http://www.eskimo.com/~archer/aprs_capabilities.html>

The three most popular ones right now are UI-View, WinAPRS, and
Xastir, in that order. The first two run on Windows, the third runs
on several different OS'es.

Please ask questions as you go along. Tell us more about what you'd
like to use it for and we might be able to point you towards a
particular program.

4150. APRS antenna

Yahoo group: APRS (2007 — 2010)
Date: 2007-03-05 23:20:45 UTC
From: kc9cbx
Topic: 4150 Message: 4150

Can anyone suggest an antenna that can be used on the inside of a vehicle? It can be homebrew or commercial. I know that it's a bad idea to run APRS station or any radio with the antenna on the inside of the vehicle, but in this particular situation it's the only way. Only requirement that I have is that it has to be inside, nothing at all on the outside. It's a company vehicle and I can't have any antennas, not even a mag or window mounted. And for those that are wondering, it's not being used for commercial purposes of any kind.

I will be running TinyTrak3 with a 5W HT connected to a cigarette lighter plug for power.

Thanks,

Laris, KC9CBX

Hi Laris

I read some time ago about antenna mounted underneath the car. I have
no experience about this and I do not know if this solution is OK for
your car. Any way see the following links:
http://www.untenna.com/article1.html
http://www.daimlerchrysler.com/dccom/0-5-7182-1-464922-1-0-0-0-0-0-8668-7165-0-0-0-0-0-0-0
.html

From Daimler Chrysler:

At first glance, at least, most of the up to 18 antennas are
invisible. "Automakers and suppliers refer to antennas as being
`invisible' when they are built underneath electromagnetically
transparent materials like plastics or glass," explains
Johann-Friedrich Luy, whose team is working intensively on new
technologies for vehicle antennas at DaimlerChrysler's Ulm Research
Center.

Examples of invisible antennas go beyond the radio antennas integrated
into windows. The TeleAid emergency call system from DaimlerChrysler
operates with antennas hidden in the rear bumper, for example. And
parts of the antenna system in Maybach brand vehicles, and in the
Mercedes-Benz CL and CLK convertible, are currently installed beneath
the trunk lid; the system has antennas for satellite navigation and
Sirius satellite radio.

I hope this can help you to find the solution.

You could get a mount that slips over the edge of your window and put your rubber duck on it. I have done that with my handhelds in the past and it works pretty well.

Probably the easiest for you to get started with would be UI-View.
I expect it should work fine with the PK-232. Join the Yahoo Groups
list for UI-View and ask questions there as required. You'll have
to get a registration number for UI-View, it's donation-ware: They
request that you donate to any cancer victim support or cancer
research organization as I recall.

Depending on the type of your weather station it may or may not be
easy to interface it with APRS. Many of the common consumer-grade
units can be hooked in though.

If you have Unix/Linux experience you might consider Xastir instead.
There are at least three ways of getting it to run on a Windows OS.
It's typically more work to get running than UI-View, but gives you
much more capability mapping-wise.

Xastir does not run on Windows. In order for it to run, it has to run in an environment built up in Windows. Even then the file must be converted (from 25kbytes to 200 Mbytes) in order for it to run. Much better to run Linux as dual boot.

Actually, Xastir on Windows is not that big. It's only 2.8 MB
according to my most recent Cygwin install. On my Linux install, it's
1.5 MB. It runs just fine in either system.

Cygwin is an interface between Unix based applications and Windows.
It mainly just maps system calls so that a Unix application can
actually run on Windows. It's not the same thing as a virtual machine
such as VMWare which has a full operating system running inside
another operating system.

Yea. Cygwin is just a bunch of DLL's, so you really can think of
Xastir as being no different than any other Windows program that
needs a bunch of DLL's to run. It's just that the DLL's are
installed by the Cygwin install instead of the application install,
so you have to do the Cygwin install first.

Of course that's just _one_ way of running Xastir on a Windows
system. There are now at least three:

1) Cygwin + Xastir
2) VMWare Player (free) w/Linux + Xastir
3) MS Virtual PC (free) w/Linux + Xastir

I've heard that option #2 is quite easy to get running and runs
faster than option #1. See the Xastir Wiki (in the docs section)
for explicit instructions to get option #2 up and going quickly.

Oops, just realised that I made a slight mistake. Just went back over the installation procedure. Using the recommended procedure first install VMware which is 28.4 Mb. This creates a folder called 'My Virtual Machines". It then calls for you to download a pre-built Virtual Machine and install in this folder. The Virtual Machine is over 500 Mb. Alternatives are to down load what amounts to a complete Linux Distro which is over 700 Mb.

I have never tried Cygwin but if this method is the 'easy' one then I think I will stick to UI-View.

The _easy_ method would be the VMWare Player install. As you stated
it would be a large download. The reason is that you're snagging a
complete runnable Linux image along with it. This gives you a lot
of power as you can then run Windows and Linux at the same time.
Obviously this wouldn't be an option for someone on dialup.

The other methods in order of easiest to most difficult would be:

*) MS Virtual PC method. I know someone who's gone through this
install but I don't think it has been documented on the Wiki yet.

*) Cygwin install via the Lintronix WinXastir network install. This
doesn't get you the latest-latest Xastir, but I believe you can then
update the package.

*) Cygwin install via the README.win32 instructions. This is
definitely time-consuming as there are a lot of steps.

The Cygwin install gets you Xastir on Windows without any Linux
involved. The first two methods get you Linux running at the same
time as Windows, with Xastir running in Linux (more powerful).

> I have never tried Cygwin but if this method is the 'easy' one then
> I think I will stick to UI-View.

There's certainly nothing wrong with using UI-View on Windows! The
install is certainly easier. There are things it cannot do but most
people won't miss those features anyway.

To recap, you can run Xastir on Unix or a Unix-like system
(Linux/MacOSX/etc), or you can run Xastir on Windows directly via
Cygwin. The _best_ method (for Windows users) is to run Xastir on
Linux via VMWare Player or MS Virtual PC, but then the downloads are
much larger due to needing the second OS install.

My preferred method is to dump Windows altogether and run Linux,
which I've been doing now at work and at home for many years. I
certainly realize that's not an option for a lot of people!

4165. APRSPoint's support for Microsoft Streets and AutoRoute

Yahoo group: APRS (2007 — 2010)
Date: 2007-03-19 12:29:49 UTC
From: hxc98
Topic: 4165 Message: 4165

APRSPoint now works with Microsoft Streets or AutoRoute as well. If you have Streets or AutoRoute, you can now use APRSPoint with it. We have made available the mappoint envronment in which you can plug in the map data of Streets or AutoRoute, so that you can use APRSpoint with the lastest maps. Version 2007 of Streets and AutoRoute are both supported. Detailed info available at http://www.aprspoint.com.

4166. Voice Alert

Yahoo group: APRS (2007 — 2010)
Date: 2007-03-19 16:44:04 UTC
From: kd8he
Topic: 4166 Message: 4166

How is "voice alert" being viewed by the general APRS community. I read an article from Bob Bruninga that was promoting the idea. I travel a lot but have not "heard" much activity running CTCSS, 100.0 on 144.39. Sounds like a good idea for attended mobile use and a great way to make some simplex QSOs on the road...on another frequency of course (146.52, 446.00, etc). Certainly would not want to transmit 100.0 tone from a home station or digi and ruin the effect for mobile stations. D700 users could monitor from a fixed station with CTCSS receive on and beacon turned off. What say you, over...
Thanks
Harry

4167. APRS Mobile Rig Recommendations

Yahoo group: APRS (2007 — 2010)
Date: 2007-03-20 02:29:49 UTC
From: blairhogg
Topic: 4167 Message: 4167

Well, the old rig I was using in the car gave up - it is about 25 years old and it doesn't owe me anything.

I've been thinking about putting an APRS system in the car and trying to decide what kind of rig to use. I'm not set on any specific setup, TinyTrak, Opentracker, rig w/ built in TNC, etc. or GPS, but will probably use my Garmin eTrex Vista until I can get one of the Oncore units working.

What are the good rigs to use? Ideally the rig would transmit APRS data during dead time on a preset frequency, i.e. 144.39, and ignore the APRS data when the rig is actively transmitting or receiving on another frequency. Multiband operation would be nice, as would crossband repeat capability.

I'm thinking the Kenwood D700 with built in APRS capability, but also looking at Yaesu FT7900 or an ICom unit. Leaning toward the Kenwood as it might play well with my Kenwood TH-F6A HT.

What is the most popular setup?

Thanks,

Blair WB3AWI

I've been using a TM-D700 for several years now. I would highly recommend it for combined APRS/VHF/UHF/FM mobile ops. Its a nice dual band rig. Plug a GPS with NMEA interface into the rig, set some parameters, and you are also off and running on APRS.

Blair,

The D700 is a nice rig, I've been lusting over one for some time now about a year now, but you might just want to hold off on it... Kenwood recently submitted the test reports for the D710A to the FCC. Its not clear if it addresses any of the shortcomings in the current model (mostly limitations of the built-in tnc), or if it is just an "unleaded" version. At any rate the long rumored D700 replacement appears to have advanced from the vaporware stage to reality.

If nothing else, it might pay to watch the D700 new and used market for some bargains soon... though the Japanese companies often deploy a strategy of raising the price on outgoing models to make the price comparison with new models seem more favorable.

I'm not entirely sure they have a choice but to replace the old TNC. Wasn't the chipset made by the now-defunct TASCO? Even if they had a huge stockpile of the chips, I doubt they'd be RoHS compliant.

Blair, if you are serious enough about putting APRS in the car, I always recommend the Kenwood TM-271. This is a basic 60W 2M mobile that is great for APRS. The best part is, Kenwood left the pads for a data jack to be added. I have two of these radio and I have added the data jack on both. This gives me full 1200 and 9600 baud interfaceability (word?). If you are just getting started, an OpenTracker 1x combo'd with a Deluo GPS just can't go worng to "get your feet wet".

The Kenwoods are nice, but limited and cannot be upgraded by a user. A major drawback in my book. You might even look at somthing like the HamHUD (www.hamhud.net) for more advanced options down the road.

If you make it to Dayton this year, come by and see Scott Miller (Agent Data Systems), Jim Jarvis (APRS World, LLC), Steve Bragg (Nichetronix) and I (RPC Electronics) at our booth. We'll have plenty of cool APRS gadgets to wet your appetite with :o)

Or get an Alinco DR-135T. Not the 135TP. The DB9 on back makes a handy, secure packet connection. And when the Tracker2 board for the 135 is available (I just made up several more beta test boards) you can drop one of those in there and get a full-featured tracker/digipeater/etc. I'll be showing that off at Dayton, too.

The 700 is the same - no A or E version. No green wire to cut. The
dealers do a software adjustment or run a script to e.g. open a wider
band.
Yes, it needs to be RoHS compliant to be sold in Europe.

And it's unlikely that they'd maintain entirely separate production lines for European and North American models. Too much duplication, easier to just make it all RoHS compliant.

What comes immediately to mind is how crowded 144.39 already is in some
areas like the greater Vancouver (BC) area and Seattle. It might have
been a better idea to choose an adjacent frequency.

From: Randy Allen
Topic: 4166 Message: 4177

Actually, Voice Alert does not have to significantly add to the traffic load on 144.39 in crowded areas. The radio is going beacon anyway and the 100Hz tone has no impact on signal length. The intent is for a SHORT voice call to get on to a voice frequency (example: KA0AZS APRS Voice Alert monitoring 146.520 voice). This lets the other party know to come up on the other frequency.

The real intent of this (If I understand Bob correctly) is for use in traveling in more rural areas, where 2 vehicles on opposite sides of the road may only have a few minutes of simplex range time, and manipulating messages could be dangerous and even illegal if it is the driver doing it.

Choosing an adjacent frequency negates the advantage of using existing infrastructure. Doing that forces you to choose getting into the national APRS system, or getting a "ping" that alerts you that a fellow APRS active HAM is in the vicinity.

I've used with moderate success, as has my wife, on cross country drives.

In town, my wife usually keeps the repeater volume turned down, but I can call her on 144.39 (Usually just stating my call sign) and she turns up the repeater side for us to pass our traffic. Assuming of course we are in simplex range. Of course our activity here (Dayton OH) is not that high, except for a certain week in May.

I think, quite honestly, that this is a non-issue, and, if it does become an issue, should be handled by the local APRS community based on local conditions.

I like WinPack.
<http://www.winpack.org.uk/>
It is still a terminal program that allows you to send cryptic
commands to your TNC, but it is easy to change com ports and
baud rates and runs under Windows.

The D700 can simultaneously transmit on 2m and 440 without a problem. You should take a look at the squelch setting on the 2m side in case it's set a bit too low. If using 440 causes the 2m side to break squelch slightly, the D700 will hold off the beacon because it thinks the frequency is in use.

Also, check under the APRS menu for the data band in use (should just be A not A and B) (Menu 3-I) and under the TNC menu (Menu 1-6-2) for the DCD Sense (should be only Data (RX) Band). If DCD is set for A and B, the radio will wait until both sides are quiet.

Yahoo group: APRS (2007 — 2010)
Date: 2007-03-23 12:47:59 UTC
From: Carl F. Rimmer
Topic: 4180 Message: 4182

It should beacon when you release the PTT. If it doesn't you either
have the squelch open or it is not in BEACON mode.

I use Band B on both 440 and 2M and it always beacons when I release the
PTT if it is sent to beacon. Also check the transmit interval setting.
It will only beacon if that interval has expired.

Good luck,

Carl W8KRF

If it doesn't need to be real-time, you can probably get APRS data into MS Access through an ODBC connection to APRS World or maybe FindU.

Do you just want to send packets to the APRS-IS, or to a local TNC?

4185. RE: [APRS] MS Access and APRS packets?

Yahoo group: APRS (2007 — 2010)
Date: 2007-03-23 23:52:36 UTC
From: Mark Ford
Topic: 3766 Message: 4185

Thanks for the clarification. This would need to be through a TNC, because we want to receive data from our scientific balloon system. I guess we might be looking at more of a straight packet system, because we also want to be able to upload packet data to the balloon system and have the flight computer take action. So basically, we want to be able to receive APRS and regular packets at a ground station, and have that station be able to parse the packets into a MS Access database. We also want to be able to click a button in MS Access and have a value in the database be transmitted as a packet up to the balloon.
Regards,
-- Mark KB1MSA

Subject: RE: [APRS] MS Access and APRS packets?

If it doesn't need to be real-time, you can probably get APRS data into MS Access through an ODBC connection to APRS World or maybe FindU.

Do you just want to send packets to the APRS-IS, or to a local TNC?

Subject: [APRS] MS Access and APRS packets?

Greetings,
A quick question regarding APRS software, specifically writing your own. Has anyone out there found a way to make MS Access send and receive packets?
Thanks,
-- Mark

4186. Decoding raw findu.com data

Yahoo group: APRS (2007 — 2010)
Date: 2007-03-29 02:38:34 UTC
From: Paul Lee
Topic: 4186 Message: 4186

Anybody can point me to how to decode the raw APRS data available at findu.com? For example with the raw.cgi function you get lines like
KC0WIF>TT2QQP,WIDE2-2,qAO,KC0WIF-1:`l)5(]M'/>"@/}
The `l)5(]M'/>"@/ part is probably the position, speed, direction and altitude code. I need a hint how to decode it.

It's described in the official APRS specification. It's on the TAPR site,
or just Google for APRS spec.

4207. pocket aprs equipment for sale by kc9gqr

Yahoo group: APRS (2007 — 2010)
Date: 2007-03-31 10:59:00 UTC
From: kc9gqr
Topic: 4207 Message: 4207

I have a hp 5455 PDA with an extra battery and usb sync, and serial cable,(then you just hook the cable up to a TNC) i have been using for my pocket aprs station i have beed messing with for the last 6 months.. I have been using aprsce and some basic maps.. You can also configure the handheld to sync up with your blue tooth phone and access the aprs network via the aprs servers also and do tracking that way if your phone has a gps on it. ANd you can also purchase gps's for this unit. I am going to be selling this unit with extra battery, cables and carrying case for 60 bucks. The orginal battery keeps it running for about an hour and the new Lithium ion battery keeps it going for 2 hours . The unit has bluetooth and wifi built it so you can configure it to hop on any wireless network.. You can also sync it to your computer via bluetooth, wifi, or the cable... Microsoft Active Sync is available via download. I used this with my thd7a and it works wonderfully.. It is running pocket pc 2002.. Please contact me if anyone would like to purchase it or feel free to give my info out to anyone who might benifit from this.. the cable and the battery alone were 60 bucks. shipping will be exact charges plus insurance no DOA

From: ssobods
Topic: 4208 Message: 4208

Has anyone tried the new Kantronics MT1200? Looks like the replacement for the KPC-3+ with smart beaconing, option for built-in GPS, etc.

No manual on-line so I'm not sure what all the capabilities are yet.

The price is still up near $200 but at least something is changing on the 10 year old design.

From: 'Scott Miller'
Topic: 4209 Message: 4210

I'm planning to make up a batch of them this week. Maybe I'll be able to convince Deluo to start producing them themselves, too. Easiest way to make one is to start with the DB9 adapter and chop off the DB9 part, or you can just solder the 3.5mm plug directly on to the GPS cable. In either case, it's:

Tip -> Green (RXD)
Ring -> Red (+5v)
Sleeve -> Black (GND)

I'm building these for use with my own Tracker2 boards for the DR-135T, but the same thing will work with the EJ-41U that comes in the DR-135TP. The EJ-41U is just not that great an APRS TNC, and has a tendency to lose its configuration on powerup.

I've got several of the T2 units on hand to sell (the firmware is still in beta test, but it's pretty stable). I was going to list those on my website over the weekend, but I wanted to offer them as package deals with the Deluos, and I'm running low on those. I at least want to have the adapters ready first.

Hi Scott I will take one of those t2 off your hands, if you would like to send me one, I already have 2 of your deluo gps's, I tried to make a interface cable from a old key board that i cut the cable from. but i run out of opitions with the wires. It shows in the Dr-135 manual that the middle ring supplys the 4.90 volts, But it does'nt it ,comes from the tip. I was trying to make it from a pinout of the ps2 plug i found on the net for the deluo, but i think it was wrong.

Scott (or anyone),
Do you know if the connectors are in the DR-135Ts that you can purchase
without the TNC? I've seen them adverted with and without the TNCs.

No sense in paying for a component that you'll remove later on to plug
in yours'...

Thanks

Yeah, I should have mentioned that. The T and TP are identical, except that the TP comes with the EJ-41U installed. Save your money and get a T - the difference is more than enough to pay for the T2-135 board.

I just listed 10 (beta) boards on my website last night. They were all gone by the time I woke up this morning, but I'll get some more ready as soon as I get a chance. Looks like I've got a couple dozen PCBs left from the first run.

I'll try to make a point of listing them during the day next time. This batch went disproportionately to Europe and Australia.

Great and Thanks.

My GE Phoenix has gone dead on the output for my IGate, so I'm thinking about replacing it with my Kenwood TM-271A thats in the car. For the DR-135Ts and the T2-135s sounds like a small component count and cost way to go.

Now that was the easy part, getting the spouse to release the funds is the harder one...

Keep up the good work and 73,

Stan,

Why not just replace the Phoenix? I just go one for about $40 on Ebay.

And it will be repaired, but the key word is AGAIN. I bought it used
from ebay also and it has been a trooper, but I looking at other
alternatives and maybe use this as backup or demo'ing.

4220. Trying not to reinvent the wheel...

Yahoo group: APRS (2007 — 2010)
Date: 2007-04-12 03:35:58 UTC
From: M M
Topic: 4220 Message: 4220

I have a GPS - based project and before I go
reinventing the wheel, I have two questions:

What layout software are people using for quickie
short-run PCBs? What board house does good quality
single sided and double sided with solder mask and
silk
screen? Board size is about 4 inches by 2 inches.
I do not want to lay out the board in a single-vendor
proprietary package and have to redo it if we have to
change board houses.

I need five or six prototypes within a week after
ordering,
then if it goes into production we will be doing
batches
of 100. Maybe as many as 5000 total.

2) Does anybody have predone PCB layouts for
euro-style
terminals strips? Or is there a package that already
has them in the library?

I'd suggest Eagle PCB from Cadsoft. For boards that size, the free version should be fine. As for PCB fabrication, I recommend Gold Phoenix PCB for short runs. No setup fee, and you can get a small batch for as low as $80 delivered. I usually see a turnaround time of 10 calendar days from payment to delivery. Just got my second shipment of the week today, in fact. There's also another company (batchpcb.com, I think) that I believe works through Gold Phoenix, but aggregates jobs for them. You can get smaller batches done cheaply with a longer lead time that way.

I'm switching to another board house for my medium to high volume stuff (500+ units), so I'll see how that goes. NRE is $350 there, which is the same as my current domestic PCB manufacturer.

FreePCB from <http://www.freepcb.com/> for PCB layouts and TinyCAD from <http://tinycad.sourceforge.net/> for schematics. The best part is that they are both free! I
use FreePCB and it works very well. I do not use TinyCAD as I have a commercial schematic editor. I know many of the FreePCB users do use TinyCAD. For my boards I use Sunstone Circuits, <http://www.sunstone.com/>.

Eagle gives you a pretty decent autorouter, and good schematic <> board forward/back annotation - I never have to worry about keeping my board in sync with the schematic. The ERC and DRC functions work well, too. The library editor sucks, but I've gotten used to it. For multilayer boards and larger areas you'd probably need at least the non-commercial license, if you're eligible.

I've been keeping an eye on the open source EDA tools, but so far I haven't seen anything that looks worth the pain. I keep hoping. And it's been a year or more since I really looked, so maybe the situation has improved.

Forward annotation is not a problem with the pair that I listed but back annotation is. FreePCB
is very easy to use, does up to 8 layers and the library editor is very good. There now is an
add-on for autorouting.

I previously used the Ivex layout software. It worked OK for two layers but as soon as I started doing 4 layers it had major problems. The company went out of business so there was no
support. That is when I found FreePCB.

APRS Content - Looking forward to the Tracker2 digipeater production.

4225. USM SciBallooning looks for Western Maine I-Gaters

Yahoo group: APRS (2007 — 2010)
Date: 2007-04-17 23:45:32 UTC
From: Mark Ford
Topic: 3766 Message: 4225

Greetings all,
Apologies for any cross-posting. This is a quick note to APRS I-Gates in Maine.

The University of Southern Maine Scientific Ballooning Group is looking to compile a list of I-Gate stations for the launch of our first scientific balloon later this month, some possible flights this summer, and a number of flights currently being scheduled for next year.

This I-Gate list indicates those stations we can count on as we proceed with the launch, flight and recovery of our payloads. The USM GIS Lab is working with us to compile a coverage map of western Maine based upon these I-Gate stations and their elevations. We hope to gain a better understanding of where we might lose contact with our payload as it approaches the ground and disappears behind mountains and buildings.

If you have an I-Gate station and would like to be included in our list, please send the following information and I will contact you directly:
- Callsign:
- Latitude:
- Longitude:
- Antenna Elevation:
- Contact Name:
- Contact Phone:
- Contact E-mail:

We will be launching from Bethel, Maine. Our operations area is focused west of Bangor and north of Portland.

We're a new group on campus, and I'm a very green ham. Input and ideas are very welcome.

Regards,
-- Mark KB1MSA

4226. D-700A Help to get into APRS mode

Yahoo group: APRS (2007 — 2010)
Date: 2007-04-24 01:39:45 UTC
From: Mike Delaney
Topic: 4226 Message: 4226

I have been trying to get my D-700 Kenwood into APRS mode. I have put callsign, etc. in, but the instructions have me lost with trying to get into APRS mode. I found the "F" key, but then it says to press "s-1", that's where I am lost.

Anyone who has a D-700A who can type me through this please reply.

I do not have any GPS plugged in, that should not matter, though.

I just need to get into APRS mode to monitor local traffic, then will install in my car with GPS. I have not tried to use the computer interface and the software from Kenwood. I do have software on my computer and will if needed, try that route.

Thanks and 73.

Mike,
It means that you should hold down the F key for 1 second. It brings
up a different menu than if you just quickly press the F key.

Date: 2007-04-24 21:27:36 UTC
From: Jim
Topic: 4226 Message: 4228

It means hold the F key down for at least 1 second, you will then get another set of options.

The lower left menu button will say "TNC", press it and "opening TNC" should appear above one of the frequencies for a couple of seconds and "TNC APRS" in the top left of the display.

F-1 followed by TNC a second time will put the radio into standard packet mode ("TNC PKT" in the top left). A third time turns the packet stuff off.

The only other thing you will need to set is which band it receives data on (NOTHING to do with the voice PTT or control band!).

Menu 3-I (letter I, not the number 1) defines this. A reverse "D" top-right of the frequency shows which is in use.

Jim

I have to say this part of the setup directions were absolutely infuriating to me when I was trying to get everything configured!! I only figured it out by accident after playing with it for almost an hour!

The "1-s" means to hold down the F key for 1 second.

I figured it out after I posted last night, thanks guys for your assist. I am helping out in our Memorial Marathon in Oklahoma City this comming weekend and waited until the last minute, again, to get ready, now its working fine. I think that I discovered it by accident, pressing harder and longer in frustration and it happened to change the menu.

4233. Re:D-700A Help to get into APRS mode

Yahoo group: APRS (2007 — 2010)
Date: 2007-04-26 17:04:45 UTC
From: Michael Delaney
Topic: 4226 Message: 4233

I found it!!!

I posted one evening and figured it out after I got
home. For anyone else out there 1 s means
hold down the key for one second. After that it was a
breeze. I felt about one inch tall after I discovered
this. Now I can't stop playing APRS. I just need to
wire my garmin etrex and go mobile now.

thanks to all who replied.

4234. TM-D700 Radio for sale

Yahoo group: APRS (2007 — 2010)
Date: 2007-04-26 23:36:46 UTC
From: Wayne Miles - N4Jep
Topic: 4234 Message: 4234

Hello everyone,

I have a great buy for everyone! I thought I would give my local
friends a chance before listing it on e-Bay or something.

I'm selling my Kenwood TM-D700 APRS Rig to make way for an HF rig.

Details about the package can be found here:

http://www.villagecircle.com/kenwood/

Feel free to contact me if you have any questions.... I can bring it
to Brandon to complete the sale if you like...

- Wayne Miles, N4JEP

wayne@N4JEP.us

or call me at (863) 604-9982 anytime!

4235. Kenwood TH-D7a cannot get to work

Topic: 4235 Message: 4235

Hello, just receieved kenwood th-d7a new. unable to xmit any aprs data out. gps unit is a garmin gpsmap76 have the interface on the gps set to nema and have the ht setup with callsign, xmit every 5 minutes, again able to see all the aprs traffic, but no xmitting out location. the cable is supposed to be a garmin/kenwood th-d7a cable (bought from ebay). on the ht itself i have gps unit set as nmea...waypoint off, my position...not showing the gps location..pos ambigu is off, pos comment is set for in service, pos limit if off, icon is set to bike, status text, dont have any, status txt is off. packet path is wide3-2, and data tx is auto...with tx interval set at 5 min..unprotocal set for apk002(default i think) beep all...display area entire disp, mile, set, temp set auto reply off, packet speed 1200bps, data band is a.
I am thinking t here is a setting someplace that i have missed. Also I have the Kenwood TM-D700A in the vehicle and runnign that with a Garmin V with no issues. The kenwood mobile has the GPS blinking when the gps data is being read, but I do not see the TH-D7A having such a feature.

Anyone have any further idea's what I can try to get the GPAMAP76 work with this ht? You help is much appreicated and welcome!

Thank you in advance....Mike

Mike

If you push the POS key do you see the correct position from the GPS?

Is BCN displayed at the top of the LCD? If not press the BCON key.

It does, but its action is exactly the opposite of the
D700 in that it blinks if it *isn't* receiving GPS data. 73

From: Jeff Sikora
Topic: 4239 Message: 4239

Hello all. I am liking for some help on setting up an old system with the new settings. I believe currently all my mobile and portable stuff is set to Wide, Relay or something of this nature. As I fell away from this for a bit I now see stuff has changed a bit. We also have a digi on top of the mountain and I am sure there are new settings needed for this one also. I've done some searching, however the more I read the more confused I get. I'd like to get all this to the new standards, so any help would be appreciated. At this time this is the only digi in about 50 miles, so I'd like to resolve any issues.

I was having the same problem recently. I discovered two things. If the gps is putting out data at 9600 baud you use nmea96 setting not the plaine nmea setting. The manual is also very specific about connecting the gps before powering up the radio. So I have been turning on the gps before I turn on the radio.

4253. KPC-9612+ as a Digipeater?

Yahoo group: APRS (2007 — 2010)
Date: 2007-05-07 00:08:23 UTC
From: apenadragon
Topic: 4253 Message: 4253

I'm part of the Cornell University ARC and we're trying to set up a digipeater using at Kantronics KPC-9612+ V8.2(as best I can tell) and I think that we have it digipeating APRS Packets... however, we can't seem to get it to show up on findu.com, or forward any packets that it recieves off to an IGATE for them to show up on FindU.com.

Ithaca, NY is a bit of a APRS vacum given the terrain, and we're trying to fill in the hole.

We're at a complete loss as to what the problem is, and I was hoping I might be able to find some help here.

Adam

Date: 2007-05-07 16:32:58 UTC
From: Jim Mastrogiovanni
Topic: 4253 Message: 4254

Adam,

The nearest Igate is in Cortland, NY about 24 miles
north east of Ithaca. The location appears to be in
the valley west of IH 81. Probably not a good location
for a digi in Ithaca to hit.

http://www.findu.com/cgi-bin/map-near.cgi?zip=14850

A quick look at findu indicates that the 2 APRS
stations that were near Ithaca were igated through
Rochester. Thats a long way from Ithaca. Probably some
sort of enhanced propagation.

I usually spend a couple of months around Syracuse
every summer and Igates are few and far between.

Do any of your club members have APRS base station
running? They should be able to hear the digi when it
IDs and see the packet displayed on the screen.
Actually you don't need an APRS station to see the
packet, just get a TNC,radio on 144.390 MHz, and PC
running Hyperterm to see the packets. It is quite
possible that the digi is working and just can't get a
packet to an Igate. What is the call sign of the digi?
What is the MYALIAS parameter set to?

Take a look at WB4APR's note here:

http://eng.usna.navy.mil/~bruninga/aprs/WIDE1-1settings.txt

You may want to consider setting up an Igate in the
Ithaca area. Cornell might let you use an always on
internet connection.

73,
Jim

Date: 2007-05-09 22:36:29 UTC
From: Adam Mahnke
Topic: 4253 Message: 4257

We do have a few people around that can hear the digi, and it show's up when I plot it on UIVIEW with a local radio, as well as the other stations that it digipeats back out. Maybe we're just not making it to the IGATE, but I can hear N2HLT's beacon directly, so I would think he could hear ours, and he gets into an IGATE, I would think that his station would send our packets on to the one that he gets in to.

The call sign of the Digi is W2CXM, and I think that the myalias is turned off, but I'll be able to check that in about a half hour or so.

I've looked at that site before, and tried to mirror it, so perhaps we're just not getting into the igates, which is weird, because I can use 2M repeaters in the cortland area from my mobile rig sitting in the parking lot next to the building that the digi is on top of. The eventual plan is to become an IGATE, as well as a weather reporting station, we're just waiting on the network to get installed in the shack.

4258. Re: [APRS] KPC-9612+ as a Digipeater?

Yahoo group: APRS (2007 — 2010)
Date: 2007-05-10 00:37:45 UTC
From: Jim Mastrogiovanni
Topic: 4253 Message: 4258

Adam,

Look over this link. Make sure that the TNC commands
are set as recommended (yes, it is for a KPC3 but the
9612 has the same commands).

http://web.usna.navy.mil/~bruninga/aprs/kpc3+WIDEn.txt

Can one of the local hams set up a temporary Igate?

N2HLT was Igated through Cortland, NY :

N2HLT>APNU19,WIDE2*,qAR,KB2FAF-10:!4236.88NS07707.68W#PHG6760/W3,NYn
Branchport NY

http://www1.findu.com/cgi-bin/find.cgi?call=KB2FAF-10

take a look at the satellite view!

Is N2HLT digipeating W2CXM beacon (ID) packets?

The station list for near Ithaca does not show many RF
to internet stations gated to Findu.

http://www.findu.com/cgi-bin/near.cgi?zip=14850&distance=50

We probably should go off list to continue this.

Hi,
I've never sold a GPS before so I figured I'd ask people who have.
I've come into possession of a Cobra GPS-1000, it has a CD set called
Cobra GPS Solutions Rand McNally Streetfinder, I think it's 2003.
I didn't get a cord with it to transfer stuff from the PC.

Hi all,

well in my parameters of my Digi,there is a command line " CD :

there is INTERNAL or SOFTWARE

Which one should i shoose ?

i am running the version 8.2 with an kpc3,not a PLUS.

And there is also the command line:

INTFACE :there is 2 choices Internal and Software

for some reason mine has been mixed and i dont know which one go there
and there????

could you help me?

thanks

You want software and the squelch on the radio turned all the way down (Not squelching).

CD means Carrier Detect. You want software because if you go hardware your counting on the radio to open up the squelch fast enough to get a clean transmission of the packet. However, many packets begin transmitting data before the radio can open the squelch..

Cheers,

ok, I've just finished mirroring the web page that listed below, I'm not sure what else to do at this point other than wait a few hours and see if we show up somewhere.

The next step will be once we get a network connection up here to turn outselves into an IGate, then it won't really be an issue. I'm not sure how much longer that's going to take, hopefully not to long.

Thanks for all of your help, but I"m starting to think that this is a propagation problem, not a settings one.

Adam,

If you look at the stations that have made it to Findu.com from around Ithaca, NY most are reporting directly via TCP/IP not RF. The stations that make it from RF are Igated from distant locations--Rochester, Binghamton , and near Scranton, PA. This indicates that to get a packet out of the south end of Cayuga lake to the internet you need enhanced propagation-ducting or sporadic e layer. If your digi is showing up on local APRS applications then I beleive that you do have a propagation issue.

When you get a local Igate up then you will know for sure.

Good luck! Let me know when you get a local Igate set up.

4265. AGW-TRACKER SET UP & TM-D700

Yahoo group: APRS (2007 — 2010)
Date: 2007-05-19 11:11:40 UTC
From: kb1dni
Topic: 4265 Message: 4265

Hello Everyone:

I am new to this group and this is my first TM-D700. I purchased this radio to install in an Emergency Operations Center. I have tried various TNC settings using AGW-TRACKER with no luck.

Is anyone using AGW-TRACKER? I picked AGW-TRACKER because it appears to have a wider source of maps available such as Google Earth, etc.

I also have a copy of UI-VIEW which I have not installed. I want the most available maps with the greatest details in the EOC.

Please let me know your opinion on which provides the best mapping options and details as well as your TM-D700 settings.

I appreciate all the assistance.

Topic: 4265 Message: 4266

Hi Glen,

Likewise, I'm a newbie to all of this. I'm the coach for a scientific ballooning group at the University of Southern Maine. We have been trying to get our new D700 to talk to UI-View had have been blessed to have a friend and APRS guru AA1XD helping us out. From our perspective (and one you may want to consider for emergency operations) we are using UI-VIEW because it is a stand-alone solution which doesn't require the internet like Google Maps does. We've found that the two biggest issues for us have been the wrong serial cable (we had a "null modem" cable rather than a straight cable) on one radio and on the other radio we had failed to add UI-VIEW to the firewall settings. (We run XP on the second radio.)

This summer I'm going to be working with some engineers to develop a flight computer, which we would like the laptop to talk with using MS Access. So if we can make Access do everything that UI-VIEW does, we may move away from that program.

Hope that helps.

For the APRS clients with the most available mapping options,
there's been one very clear leader for many years now: Xastir.

It doesn't handle Google Earth though. For online mapping it uses
Tigermaps for street maps, Terraserver for topo's and aerial images.
Where it really shines is with local maps. At last count we handle
125 different map formats.

Disclosure: I'm one of the (many) developers. None of us make any
money from it, so we have no financial interest in whether you run
it or not.

Xastir is natively a Unix application, so runs best on Linux or
MacOSX. If you _must_ run Windows, there are three options so far
for using Xastir. I'll order them from most to least desirable:

VMWare Player with Xastir/Linux image.
Microsoft Virtual PC with Xastir/Linux.
Cygwin w/Xastir.

We have the most support in our docs and Wiki for the first option.
The first two options run faster than the third. All are free
downloads.

4268. Bob Bruninga Presentation at Dayton Hamvention

Yahoo group: APRS (2007 — 2010)
Date: 2007-05-21 19:57:43 UTC
From: Carl F Rimmer
Topic: 4268 Message: 4268

I am a relatively new APRS user. Hearing Bob's presentation at the APRS forum at Dayton on Saturday opened my mind to much more than what I had consider APRS. I was using it mostly as a tracking system but occasionally, I would beacon an object marking an event or place. I wasn't sure if I should be doing that or not. I've not seen too many other objects of that nature in the area (Cleveland). After hearing what the founder of this system said, I will start using it for those sorts of things more often. I personally think that some new or different symbols need to be developed, however. I was looking for a symbol to represent a club meeting and found nothing. I decided to use the Ham store symbol because it is a building with HAM on it. I note that there are a few symbols on both the Primary and Alternate Table that state "No Symbol." Could one of these be designated as a Club Meeting location symbol with an appropriate icon?

Just a thought. I would like to see APRS used as it was intended as well as for tracking.

73,

Carl W8KRF

The "eyeball" symbol is the one that has been suggested before. On
some clients it appears larger than other symbols as well. It's
supposed to attract your eye to that part of the map, then you click
on it to get more info about that object.

...and in regards to Bob's efforts to encourage non-gps use of D7's in pedestrian settings, wouldn't it be nice to have one (or more) realistic pedestrian icons in addition to the 'jogger'.To take some literary and technical license, one icon might be worth a thousand collisions, if there was a variety of pedestrian icons to choose from: hiker, recreational walker,rest stop attendant, first aid attendant, monitors of different types, shopper at a Ham fest, are a few that come to mind and would be another good use of some of those "no symbol' positions that Carl refers to. This would give visible evidence of Bob's contention that a gps unit is not necessary in many APRS venues plus possibly expanding the number of realistic APRS uses.

4271. KPC3+ Question

Yahoo group: APRS (2007 — 2010)
Date: 2007-05-22 13:28:29 UTC
From: Jim
Topic: 4271 Message: 4271

A question for all KPC3+ experts out there.

Is there a way of BULIST-ing or excluding certain stations, to control what a digi will actually repeat?

I have a scenario with eight KPC3+ digi's in a mountainous area, which are set up to get location beacons back to a central point.

Digi's are hill-top, so I want to stop beacons from being repeated in areas they don't need to be (i.e. cut don the redundant RF traffic).

Control of the route via the sending station is not possible as they can be anywhere, which is why I'm looking for a "system" solution. KPCs are running v9.1.

Jim, G1HUL

Hi all,

Jim wrote:

>Is there a way of BULIST-ing ... certain stations?

That would be the LidLIST command. Usage is LLIST G1ABC,G2DEF-2
in order to suppress packets from G1ABC (with any SSID) and G2DEF-2.

>I want to stop beacons from being repeated in areas they don't need to be ...
>Control of the route via the sending station is not possible ...

The LidLIST command won't take care of this situation. It's used
(obviously) for stations that won't, uh, accept constructive criticism. User
education might be the answer here, but for stations that don't take the hint,
this last-resort method will work. 73

Thanks for the pointer on LLIST, if it works on the VIA list that might be the answer.

The system is set up for a special event and totally "closed" as it's off the main APRS frequencies and we control the equipment setup, so it's not a user issue, just trying to squeeze the last bit of efficiency from the system.

Jim

4274. RE: KPC3+ Question

Yahoo group: APRS (2007 — 2010)
Date: 2007-05-22 23:52:00 UTC
From: Arte Booten
Topic: 4271 Message: 4274

Hi all,

Jim wrote:

>The system is for a special event and ... off the main APRS frequency - it's
>not a user issue.

... which brings us back to your original ...

> >Is there a way of BULIST-ing ... certain stations?

... which makes this a different issue. Just use the BUdlist command.
eg: BUDL N1ABC,KB2DEF,W3GH,AA4IJ etc. for all participating stations. This'll also cover any SSID's they use (ie: N1ABC-7, N1ABC-9, N1ABC-14, KB2DEF, W3GH-3 etc. will all be able to use this system). From the KPC-3 Plus manual:

==========

BUDLIST [ON|OFF] [NONE | {+|-}call | call1,call2,...]

where call={callsign | {<|>}callsign | callsign{>|<>}callsign}

default OFF NONE

BUDLIST is used to determine which received packets will be monitored. When OFF or NONE, BUDLIST will allow monitoring of all packets, even if it has callsigns in its list. The maximum number of callsigns allowed in BUDLIST is 10. Up to 10 callsigns may be entered at once, using the format shown after the command name, and the new list of from 1 to 10 callsigns will replace whatever list was there before.

The BUDLIST command can be used to add a single callsign (+callsign), so long as there is room for the new callsign on the list (if there is not, the TNC responds with "EH?" and returns you to the command prompt). Similarly, you can remove a single callsign (-callsign) from the list. And to remove all items from the current list, enter BUDLIST NONE. A callsign entered without a SSID will match any SSID of that callsign. To match a specific SSID only, enter the callsign with that SSID: for example, callsign-n, where n =0-15.

More selective monitoring is enabled when a callsign or two callsigns is combined with a ">" and/or a "<" character. For example, entering ">callsign" will enable monitoring of packets TO that callsign (assuming BUDLIST is ON), entering "<callsign" will enable monitoring of packets from the callsign, entering "callsign1>callsign2" will enable monitoring of packets from callsign1 to callsign2, and entering "callsign1<>callsign2" will enable monitoring of packets from callsign1 to callsign2 and vice versa.

Note that entering callsign1>callsign2 or callsign1<>callsign2 counts as two
of the 10 maximum allowed callsigns.

==========

I hope those of you here also noticed the pertinent replies given on the
main TAPR APRSSIG as well. 73

4275. RE: [APRS] RE: KPC3+ Question

Yahoo group: APRS (2007 — 2010)
Date: 2007-05-23 06:54:36 UTC
From: Jim
Topic: 4271 Message: 4275

Problem with BUDLIST is that it only acts on the source/destination
callsigns, not the intermediate digipeaters.

We want all beacons to get into the system, but segment the digipeaters so
that ones in once half of the system won't repeat beacons being passed
around the other half.

Jim

4276. KPC3+ V8.3 - soft reset? and other questions

Yahoo group: APRS (2007 — 2010)
Date: 2007-05-23 18:57:25 UTC
From: Broncus
Topic: 4276 Message: 4276

Greetings,

I have noticed that when I have a terminal connected to the 25 pin connector on the KPC3+ that the opening data appears regularly. Is the unit doing a soft reset? Afterwards it is left in command mode (not a surprise here).

I have connected the TNC to my FT1500 through the data port. I have still noticed the soft reset issue. I have also used a PDA rather than a laptop and it still does the soft reset.

Second, I am not seeing any data on the terminal after pressing 'K'. I am thinking that I should be able to see data transmitted from other stations as well. Maybe there is another key sequence or the radio is deaf. I can hear packet data from the radio speaker. Changing to the FT1500 does not allow me to see received data either.

Since, I have seen my station on FINDU.COM, I know the radio is transmitting data.

I am running a KPC3+ with a Radio Shack HTX-252. The HTX-252 has a output connected to the IF filter (? it was a listed mod) before the squelch circuit. CD is set to SOFTWARE. The GPS is connected to the Radio Port along with the radio.

I know of the output level adjustment but is there a input level setting as well?

Thank you for any help you my provide!

Best regards,
Fred

Does it have a serial port? If yes, does it send data at 4800,8,N,1? If yes, I would say yes.

I suspect the soft resets are nothing to do with pin 25, as there is nothing connected to it internal to the unit.

Is the power supply stable and have you used the correct size of plug (i.e. not loose)? 99% of problems of this sort I've seen are caused by using a plug designed for the bigger centre pin.

When you hear data, is the receive LED lighting on the TNC?

You should not be putting the TNC into converse mode (K) to monitor, simply leave it at the command prompt and anything it receives will be sent to the terminal.

K is only for switching back into converse mode during a connected session, if you have returned to command mode for any reason.

Jim, G1HUL

Hi Jim,

Thanks for the reply!

I have an internal battery as well as the power supply connected. Either supply gives the same results. Bouncing the TNC does nothing either.

I have the TNC and HTX-252 sandwiched together with about 1/2" between them, but the FT1500 is about a foot away when I try that.

I have never seen anything but command echoes (and reset info) in command mode. I wonder what the issue is here. Time to double check wiring. Any input signal adjustment?

Best regards,
Fred

Hi Jim,

I am sorry I meant to say the '25-pin computer port'.

There is a way to reset the unit externally through the DB9 (radio/GPS port) but it is jumpered to GND. I checked that yesterday.

Best regards,
Fred

Art
i have read your message,
if i understand corectly,
i would use the LLIST to reject all traffic coming from a specific digi or
station?? am i right?
i am asking that because i have a node so much well located that i can hear
120 milles away another digi that is located near a igate so it is a
problem for me , and them too so i want to rject any traffic from this digi
so i would add his call letters in LLIST???

73/s and thanks for the explanations

Who is "their"? If the "their" you're talking about are users,
that's a user-defined parameter. Each user determines how often they
are going to beacon. The only control you, as the digi sysop have, is
to try to educate them into using a more sensible beacon rate. In the
New York City metropolitan area (which is where I live), a reasonable
rate is once every three minutes for mobiles and once an hour for base
stations that have no other pertinent data (WX stations, InfoKiosk and
other similar stations are a bit different).

>unproto: aprs via wide2,wide2 is the new setup?

It's slightly more complicated than that. The TOCALL field could
use "APRS via", and that would work well enough, but the latest specs
call for a more specific TOCALL based on the hardware/software which
is originating that packet. For a comprehensive list by the father of
APRS, see: http://web.usna.navy.mil/~bruninga/aprs/tocalls.txt . For
a KPC-3 Plus running version 9.1 firmware your TOCALL would be APN391.

As for the actual VIA path, there are points about which authors
of APRS and I have slight disagreements. Let me explain. I've been
running APRS since 1995, when the only flavor of APRS was what we now
refer to as APRSDos. At the time, there was no I-gate system. DIGIs
were erected using whatever TNC happened to be available. EVERYTHING
was via RF, either on the VHF frequency of 145.79 (which is what was
used at the time) and/or on 30 meters at 10.151 LSB. WIDEn-n was but
a dream that Bob Bruninga WB4APR (that self-same Father of APRS) had,
but was not yet supported by the available hardware.

So, along the eastern seaboard of the US, from Boston to northern
Virginia, a bunch of local APRS networks appeared. The only ALIASes
available on VHF were RELAY and WIDE, which are both now obsolete. If
I wanted to send a one-line message to Bob B who lives near Baltimore,
I'd have to send it via a path with five hops. If I'd used a path of
APRS VIA WIDE,WIDE,WIDE,WIDE,WIDE , it would have produced hundreds of
duplicates, clogged the APRS network from Boston to Virginia and would
not have made it to him, except by miracle.

But, if you knew of a reliable path, specifying which digipeaters
you wanted your packet to take, it was possible. At the time, I could
reliably send messages to Bob, Rich Amirault, (N1JDU) in Boston MA and

stations in Rochester, NY and central Pennsylvania ... by naming each digipeater I needed in that path to support propagation. Unless I am mistaken, this capability still exists in a WIDEn-n compliant APRS network ... but it's frowned upon and, by-and-large, unnecessary given the existence of I-gates. It produces a lot of overhead on VHF and is wasteful of the limited bandwidth available in an APRS network.

This is why Bob B. envisioned WIDEn-n ... which is now widespread throughout North America and beyond. Read about the reasons for this, and how to best implement it at his web site, and in his words at: http://www.ew.usna.edu/~bruninga/aprs/fix14439.html . With the I-gate system and available hardware/firmware/software, long paths are rarely needed and not recommended anymore. Many APRS clients can automagically figure a return path to whomever sent you a message. I've configured my home station as a WIDE1-1 fill-in digi, when it used to be a RELAY. So, I agree that WIDEn-n is far more efficient than the old way.

Sorry for ranting on like this, but I thought a little background might be enlightening. I've seen APRS take many advances through the years, but WIDEn-n has, as Bob suggested so long ago, significantly fixed 144.39. It makes path selection simple and universal. The only addition I'd make is that a fixed station should name the digi used on their first hop - a recommendation supported by Bob B. and others. 73

wel Art,
by their i mean the other users and sysop of digi's that i received phone calls not always ,,,,,,,,humm well i wont get into this here but they were not always polite .

well may i send you my digi's setup via email and you could advise me on my settings,what need to be changed !!!
i am not an expert on aprs,i am offering the service in my region and if i may i would like to have it on "les r?gles de l'art" as they say but always thinking on my geographic position,,,we are surrond by mountain,,,not big but we have some .
my digi,ve2ckn-3 is located in a really great site ,with no interference from
cell or pager transmetter,so i wont to use it corectly.

thanks for the conversation and i am waiting your come back
73/s all here in the group

gervais ve2ckn

It's the bottom cover you want to remove. There are four screws, small black phillips ones at the corners of the plate. Remove those and it'll come right off. Unless they made major changes between Mk II and Mk III, anyway. There should be a diagram in the manual. Did you get the EJ-41U TNC, or one of my T2-135 boards?

4290. 135T/T2-135 Questions

Yahoo group: APRS (2007 — 2010)
Date: 2007-05-26 20:43:46 UTC
From: Richard Bauer
Topic: 4271 Message: 4290

i must have my stupid hat on this afternoon.

i've got the T2-135 installed in the 135T and i have it configured using the OTWINCFG.exe program (i also checked the settings using HyperTerminal). i have the Deluo GPS receiver plugged into the front connector of the 135T. i assume there is no setup needed for the Deluo???...plug n play, right??).

i've set the parameters as suggested in the T2-135 user manual and MYCALL is set to N9DKO-1. i have written the config file to the T2-135 and then checked the settings with HyperTerminal. i have a second radio monitoring 144.39 and am not hearing, or seeing, the DT-135 beacon. if i put the T2-135 into CONVERSE mode i CAN transmit a packet but the radio/tnc is not beaconing. yes, the DR-135T is in data mode.

since i can communicate with the T2-135 and can send a transmission using the CONVERSE command i have to presume that i have it installed correctly in the radio. i am pretty sure there is no APRS activity where we are currently camped as i am not hearing anything on 144.39 but i should be hearing my DT-135 beaconing anyway, right?

i suspect that i have either set one of the parameters wrong or have not set a parameter that i need to set. my settings list follows. any help is appreciated.

There shouldn't be any setup for the Deluo, but you want to make sure you're getting data from it. On the Mk II you'll usually hear a bit of crosstalk from the GPS data on the speaker - not sure about the Mk III. Wiggle the GPS connector a bit and listen for any change - that's the most likely place for a hardware failure. Every once in awhile a cable will test good but will stop working when you move it the wrong way. You can also turn TXNOFIX on and see if it starts beaconing.

ok...i'm 'hearing' the cross-talk from the GPS antenna...i wasn't before. i reset the cables and am now hearing it. the radio would still not beacon. i reset config1 in OTWINCFG.exe by importing config 2 into config1, reset MYCALL and wrote config1 to the T2. as soon as i exited the radio started beaconing and continues to beacon. i'm still not hearing any other packets so i am assuming that there is no APRS activity where we are (zip 61074, mississippi palisades state park, savanna, il).

one other issue...the POS parameter is returning GPS 4208.68N 09009.98W. i assume that means N68.4208 and W98.09009 and when i plot that on my StreetAtlas map i get a location in open water in the far, far north of canada. my current GPS position is N42.136989, W90.151792. thoughts on that?

thanks for the help.

Unless TXNOFIX is on, it won't transmit a beacon unless it either has a GPS fix or a manually-entered position. Also, I think you had smartbeaconing on, so keep in mind that if you're not moving it'll be at the lower beacon rate.

So.. best thing to do is either set TXNOFIX ON, or use the POSITION command to set your coordinates and see if it starts beaconing.

Watch out on the profile switching - with the T2-135, the 'jumper' on/off is affected by whether a PC is plugged in or not. This lets you switch between configurations for standalone and PC operation, but it can be annoying when you hook up to the PC and don't realize you're now configuring the wrong profile.

The position sounds right - that's in degrees and decimal minutes. 42 08.68N 90 90.98W shows up in Palisades State Park, just off Marina Rd I think.

If the GPS adapter keeps giving you trouble, let me know and I can send a replacement. This first batch was hand-assembled... I've got factory-build units on the way but I'm not sure how long that'll take.

---

ok...i'm 'hearing' the cross-talk from the GPS antenna...i wasn't before. i reset the cables and am now hearing it. the radio would still not beacon. i reset config1 in OTWINCFG.exe by importing config 2 into config1, reset MYCALL and wrote config1 to the T2. as soon as i exited the radio started beaconing and continues to beacon. i'm still not hearing any other packets so i am assuming that there is no APRS activity where we are (zip 61074, mississippi palisades state park, savanna, il).

one other issue...the POS parameter is returning GPS 4208.68N 09009.98W. i assume that means N68.4208 and W98.09009 and when i plot that on my StreetAtlas map i get a location in open water in the far, far north of canada. my current GPS position is N42.136989, W90.151792. thoughts on that?

thanks for the help.

ok on the config switching. i just wanted to 'zero out' config 1 and since i hadn't changed config2 i just imported 2 to 1 effectively erasing the changes i had made to 1. then i just entered my call into MYCALL and saved it. smartbeacon is off for now. still beaconing but still no other activity. thanks again for your time. i'll let you know about the cable once i do the final install in the RV.

73,
rich, n9dko

Watch out on the profile switching - with the T2-135, the 'jumper' on/off is affected by whether a PC is plugged in or not. This lets you switch between configurations for standalone and PC operation, but it can be annoying when you hook up to the PC and don't realize you're now configuring the wrong profile.

The position sounds right - that's in degrees and decimal minutes. 42 08.68N 90 90.98W shows up in Palisades State Park, just off Marina Rd I think.

If the GPS adapter keeps giving you trouble, let me know and I can send a replacement. This first batch was hand-assembled... I've got factory-build units on the way but I'm not sure how long that'll take.

From: wb5nfc
Topic: 4298 Message: 4298

Greetings all. I'm new to the group and new to APRS so this will probably be a dumb question... my apologies in advance.

I'm located in an area with NO APRS activity within at least 50 miles, so I want to set up a gateway. The site, radio, and antenna pose no significant problems. I've located a KPC3 (not KPC3+). Can the KPC3 be set up as a gateway station or should I keep looking for a KPC3+?

I will be using Kenwood TS-2000, TH-D700, and TH-D7.

Thanks in advance.

John / WB5NFC

John,

You will set up ap gateway with the software you are using. If you use UI-View you do the gateway setup in there.

A gateway between what and what? Keep reading ...

>The site, radio & antenna pose no problem. Can the KPC3 be set up as
>a gateway.
>I will be using Kenwood TS-2000, TH-D700, and TH-D7.

The KPC-3 (and, for that matter, KPC-3 Plus) is a single-port TNC which can't gate anything. It can only digipeat what's already on the frequency. If you were to use a KAM, KAM Plus, KAM XL, PK-2232 or some other full-featured dual-port HF/VHF controller, you could set up an HF to VHF gateway.

If you simply want to monitor APRS traffic from the internet, you can use one of several APRS clients that allow that, including UI-View and WinAPRS ... just to name two. No doubt, someone will post a link to a comparison of APRS clients that exists on the web but the URL is not coming to mind right now.

There's another way to generate more local APRS traffic if you've got any pull with your local repeater group. A dual-port TNC can be connected to the repeater's input, listening for a special form of APRS packets. For more info on this, check out the following link:

http://web.usna.navy.mil/~bruninga/APRS-docs/MIC-E.TXT

and scroll down about a third of the way. You might also want to see:

http://www.weca.org/wcaprs/#mic-e and

http://www.weca.org/wcaprs/oldaprs.html . I cite these because I know that specific repeater and its history with APRS, but there are quite a few such MIC-E enabled repeaters around the world. 73

From: John
Topic: 4298 Message: 4301

Thanks for the reply, Robert. I've been busy reading and experimenting since my original post. It was a busy, but productive holiday weekend. My temporary digipeater/igate is operational with my TS-2000 at my home. I still need to set up mountaintop site to free my 2k from mundane duties and increase coverage in a barren stretch of North Arkansas.

Now that I've learned a LOT more <g>, guess my original question should be rephrased: I've found an igate 37 miles away that can be reached through a digipeater and even direct from some locations in town. There is no Internet access available from my proposed mountaintop site. Can my existing KPC-3 be used as a stand-alone digipeater? Should/can it be upgraded?

Thanks again for your help. There are no local APRS Elmers to guide me, so I'm depending on the group's indulgence while this newbie gets up to speed...

Another way to find it: Do a Google search for "we7u", go to the
home page, and a link to the "APRS Client Capabilities Chart" is
listed on the left. Looks like a Google search for "aprs client
chart" gets you there quickly too.

I should have mentioned another couple of good resources that are
good for newbie and experienced APRS'ers alike:

<info.aprs.net>
and
<nwaprs.info>

For those that think findu.com is the end-all/be-all for APRS web
mapping, here's another site, completely independent of findu, which
is run entirely using open-source software:

<aprsworld.net>

Date: 2007-06-01 16:36:25 UTC
From: Broncus
Topic: 4276 Message: 4306

Yesterday I met with a friend and connected a laptop to his KPC3+
(V8.3).

I started with the TNC in command mode. No data ever was displayed. I
saw the RED LED several times. this makes 2 TNCs and 3 different
radios this has not worked with.

After pressing K, we could see the data being sent from the station.

Any other clues as to why the receive data might not be making to the
laptop?

Thanks!

Best regards,
Fred

While I am doing this testing, I am using Hyper Terminal. I imagine
there is a better option for seeing the hard data (no mapping yet).

As a follow up question, should I see the transmitted data in command
mode or just the received data?

Thanks!

Best regards,
Fred

4308. Need Elmer in SF Bay Area

Yahoo group: APRS (2007 — 2010)
Date: 2007-06-04 19:23:38 UTC
From: MarcGorelnik
Topic: 4308 Message: 4308

After dabbling on the fringes of ham radio in the late 1960's and early 1970's, I finally got around to getting my ticket last year. (For the record, with Element 1.) I've got an APRS station running on my boat (K6MMG-1), but I feel that I'm only stratching the surface with this tool. For example, I'd like to be able to log all position data for later manipulation. And how to parse the data? How to populate a personal web page with data and messages? All of this has been and is being done now by others. I don't want to re-invent anything.

So, I need an Elmer familiar with APRS and web applications in particular. I can be contacted by email off list. Thanks in advance.

Marc

4309. Using an original KAM for APRS

Yahoo group: APRS (2007 — 2010)
Date: 2007-06-05 20:01:26 UTC
From: Richard Bauer
Topic: 4220 Message: 4309

a buddy dug around in his shack closet and came up with an old KAM...probably an original version as KAM 5.0 is stamped on the chip...i assume that's the REV level. well, we powered it up and connected it to my XP PRO laptop. i fired up HyperTerminal but was unable to communicate with the KAM. i tried all baud rates from 300-9600, 8/N/1 on COM 1 with no joy. tried a couple of different serial cables with the same results. i use the same laptop to communicate with my TU-135/Alinco DR135T with no problems so i know the laptop serial port is good and i know the serial cables are good.

my question...before i go to the trouble of trying to troubleshoot this relic is it even possible to run APRS with it? if the answer is yes then i'd appreciate hearing from other KAM owners with suggestions on how to fix the communications problem. if the answer is no, anyone wanna buy a KAM? ;o)

thanks es 73

Try PacTerm. http://www.kantronics.com/downloads/pacterm2.zip .
It defaults to COM2, but one keystroke will toggle COM1 (F6, I think).

>Is it possible to run APRS with it?

You can't run a digipeater with it, nor can you use it with a GPS
but you can run an HF/VHF APRS station with it. You can even gate HF
traffic onto your local VHF APRS network. 73

well, that's good to know. don't need to run a digi as there are plenty of them here (suburban chicago) and i don't need a GPS since it will be a base unit and i think i can insert the GPS coords in the beacon text. but..since i posted the original message i found a note in the KAM manual for a hard reset. followed the steps carefully and now the darned thing won't come out of transmit mode. can't say for sure but the unit may be toast. gonna keep fiddlin with it. i'd welcome any suggestions.

From: wb5nfc
Topic: 4220 Message: 4313

Same questions as posed recently by Rich concerning use of old TNC for APRS... but different brand: Will a KPC-3 run a digi? I've been able to talk to it with hyperterminal, but not sure how to program or even IF it will.

Will be used in an isolated area of North Arkansas 30+ miles from the next nearest digipeater. Thanks in advance for any guidance.

John / WB5NFC

Hi all,

John wrote:

>Will a KPC-3 run a digi?

You didn't say which firmware version it has but a KPC-3 has the
capability to digipeat a packet. This doesn't mean it can be used as
an APRS digipeater. See http://www.ew.usna.edu/~bruninga/aprs/fix14439.html .

Hi all,

Gervais wrote:

>I have a KPC-2 Version 5.0 run[ning] as a RELAY ...

RELAY IS OBSOLETE! See
http://www.ew.usna.edu/~bruninga/aprs/fix14439.html
for the reasons why and what you can do with older TNC's. Kantronics
never upgraded the KPC-2 past 5.0, nor did they do so with KPC-4. The
KPC-3 (non +) can still be upgraded to version 8.2, but isn't suitable
as a modern digi. Similarly, the KPC-9612 and KAM (non +) shouldn't
be used as a digi either. A KPC-3 Plus, KPC-9612 Plus or KAM Plus
running version 9.1 can.

There are software alternatives that use a PC as the brains of a
digi. Some (including a KPC-2) will use a TNC in KISS mode. Others
will output packet tones, using the sound card of the computer. For
more info, see http://www.soundcardpacket.info/ . 73

Arte & the group,

The firmware is V 5.1. Obviously, I'm new to APRS and struggling to understand the terminology and concepts. I've tried to do my homework by reading up on the "new paradigm" information, but the nuts-and-bolts of making a system work while maintaining compatibility and RF-friendly environment are still a bit fuzzy. I understand the need for changes to the overall system - especially in areas with a great deal of activity. However, I'm in an area of the country with NO APRS activity. A couple weather stations show up on the map, but that's it for about 30+ miles. I can occasionally hear (and from a very few locations hit) the nearest Igate near Harrison, Arkansas. Otherwise, I'm just talking to myself when it comes to APRS. So that's what's driving this project. I've been looking for a TNC that will work as an APRS digipeater. My first find was this old KPC-3. I purchased a TNC-X at Dayton, but failed to get the Digi daughter board. It's now on order. To move the project forward and work on the RF portion of the system, I was hoping to temporarily use the KPC-3 OR to be able to upgrade its firmware to make it the primary TNC and/or use the TNC-X as a fill in. I have access to a good mountaintop RF site, a vhf rig previously used in a DX packet cluster that I picked up at the flea market in Dayton, and a vacuum around me when it comes to knowledge of APRS. Thanks to everyone in the group for your patience and understanding while I learn to navigate in this new (to me) digital frontier.

>I was hoping to temporarily use the KPC-3 OR to upgrade its firmware ...

A KPC-3 5.1 can only be upgraded to version 8.3, which is ok for a
fill-in digi but won't be compliant with the "New Paradigm". Set your
MYAlias to WIDE1-1 , which will (hopefully) allow users to get into the
nearest WIDEn-N digipeater.

There's another YahooGroup that's for APRS'ers in Arkansas:
http://groups.yahoo.com/group/APRS-AR/ . John might find folks that
have more intimate knowledge of the topography of both the land and RF
than I.

>... or use the TNC-X as a fill in.

Once you get the daughterboard, it should make a great digi. If
I were you, I'd hold off until you can do it "right".

Thanks for the great information, Arte. Joined the AR group (no recent activity in the message area, however). Got a confirmation email that the daughter board will be shipped today. Based on your input, I'll wait for its arrival and get busy learning about setup later today. Fun stuff - just a steep learning curve with no local Elmers. Thanks for doing so remotely!

doesn't seem to have one, curt. the unit powers up just fine...but it's not communicating with me. prior to my trying a hard reset the KAM was receiving packets (the receive light was blinking and in sync with the radio) but it was not displaying them on the screen. i tried a number of comm port settings..baud rate, xon/xoff/ hardware flow control, etc. no joy on any of it. since the hard reset (which is supposed to return the unit to factory config) the KAM still powers up but seems stuck in XMIT mode. any KAM guru's out there???

ok...i've got the KAM working with UI-View32. i have the unproto address in UI-View set to WIDE2-2 as per the recommended settings for home stations in the path section in the APRSWiki article. beaconing is set to 30 minutes in UI-View. i have NOT set any beacon text or beacon interval in the KAM as i'm lead to believe that this will result in duplicate and excessive beaconing. i have several questions:

1) i see my station plotted on the UI-View map but when i query my call in FindU.com, APRSWorld.Net or other APRS search engines no records are found. i have my lat/long coords set in UI-View. what am i missing or forgetting to do?

2) once i solve problem #1 how do i best determine if my home station would be appropriate to use as a fill-in digi? is there some sort of coordinating group? i'm in west suburban chicago.

3) some articles i've read suggest using an SSID of -0 for a home station but none of the fixed stations i see on the map are using -0. is no SSID taken to mean the same thing as -0?

thanks for the help.

1) UI-View requires that you include the destination address in the Unproto path. Use APRS,WIDE2-2 for a home station. See the UI-View help file for more on this.

2) This requires input from the local APRS community, someone with knowledge of the local area and the local needs.

3) No SSID is the same as a -0 as far as the network and protocol is concerned. Leave it off and just use your callsign.

Check on that last. As I recall UI-View does something weird with
that field, as in you need both the DESTINATION address and the PATH
in that particular box in the config settings. So something like
"APRS,WIDE2-2" should work. Like I said, check on that. I don't
run UI-View, but that's something I recall as being a problem that
is often reported.

Other APRS clients have the DESTINATION address fixed, and the PATH
fill-in box can't change it.

More than likely it's due to the wrong DESTINATION call being set.

to which Curt M. responded:

>... something like "APRS,WIDE2-2" should work. Like I said, check on that.

For the last version of UI-View, you should use "APU24N,WIDE2-2",
assuming you can be heard by a WIDEn-N digi directly. This lets other
users know what flavor of APRS you're running.

>How do I determine if my home station would be [good] as a fill-in digi?

Your area is pretty flat. Look in Lists > Direct Stations to see
how well you can hear without digipeaters. This should give you some
idea of the local APRS topography and help you with that decision.

>Is no SSID the same thing as -0?

Yes.

<snip>

NO, this is not correct. UI-View itself changes the destination APRS to the
APUxxx when it formats the packet. The xxx part will vary depending on the
version of UI-View being used.

This is also spelled out in the help file, as well as the explanation of the
coding used to determine what shows up in place of the xxx.

In the USA, with UI-View, you should use APRS,WIDE2-2 for a home station,
and APRS,WIDE1-1,WIDE2-1 for a mobile station.

This is not correct. You should use APRS as the destination address.
UI-View will then convert it to show the correct version number. By
the way, there is a very active Yahoo UI-View group:

thanks for the info on the group, jim. i've set my unproto path to APRS,WIDE2-2 and a few minutes later my station showed up in FindU. i also did some more google hunting and found a northern illinois forum where i can query about the need for a fill-in digi. i'm hearing a lot of stations but very few on direct. i'm assuming that means that my station is not *needed* as a fill-in but i'll check that on the local forum.

thanks again to everyone who replied. this APRS newbie appreciates the help.

What OS is that? PalmOS or WinCE? I'm pretty sure that's an HP, so
I expect it's WinCE. Check out APRSce.

Go to the link below and look on the left for the Client Comparisons
chart. At the bottom of that chart you'll find links to each of the
major APRS packages, including APRSce.

Wolo, you probably will never be able to "locate" a serial cable to connect the D7 to the Jornado720. You have two choices: Make one, or pay someone to make one.

Take the standard serial cable that comes with the D7, and the standard serial cable that comes with the Jornado 720, and either solder them together or build an adapter to plug them together. You will probably need the docs for both cables to figure that out.

Or, call any custom cable maker and ask them to build one for you.

But lcoating one? Unlikely, unless your Jornado has a standard DB9M serial port on it.

Wolo-
"Ok, the Jornada 720 uses a usb
port cable...that connects to and from the pc itself."

No, no, no. The Jornado 720 is a USB SLAVE DEVICE, it must connect to a USB MASTER CONTROLLER. The USB port in a computer is a master controller, it requires a computer operating drivers for it to work. The USB cable is only one of three things needed for USB devices to communicate. (Those being, a slave, a cable, and a master.)

So forget about USB for APRS and radios, there is no USB master controller running drivers and intelligence in APRS devices.

Serial devices typically can operate directly at the hardware level, no "intelligence" no "controller" no master devices or drivers needed to make them work. No "intelligence" means the operator has to manually make the parameters match up, the operator has to supply all the brains.

HP shipped the Jornado with a serial cable--so they claim--for those purposes. If you do not have one, buy one. Forget about using USB for APRS devices. That's like trying to use the remote control from your home theatre center to work you car. (The car has no idea what it is, or what it does, and it will simply never respond.)

Jornada serial cable, D7 serial cable, and you get to connect the two up. If you get the TX/RX wires backwards, connect them the other way. They're dumb enough not to cause any damage if you get them backwards, as most of us have.<G>

4343. Weird intermittent problem

Yahoo group: APRS (2007 — 2010)
Date: 2007-06-25 22:37:44 UTC
From: Kenny Wyss
Topic: 4343 Message: 4343

This is strange, and maybe someone can think of something that I am overlooking. I run a KPC3 with the newer version 8.2 ROM, along with an older Kenwood TR-7930 as a full-time digi. I programmed all the settings in according to the setup tips from Bob Bruninga and occasionally, I will launch UI-View just to play around and see what's out there. I have noticed that sometimes I see activity on the radio via its lights, but it's as if packets are not being decoded. I have done a hard reset and reprogrammed all the proper settings, but it seems to come back to haunt me. Today for instance, I noticed practically no stations on the screen, even though the VHF band was hot. I stopped UI-View, went over to Paket and monitored the raw data, and saw stuff, so then relaunched UI-View. After that, it appeared to work fine. Within UI-View I am using RTS/CTS handshaking.

Has anyone had any intermittent problems with UI-View? I am wondering if I am having TNC issues or what it could be.

Kenny, KB0NPW

When it stops working, is the "CON" indicator (LED) on constantly.
I've had this happen to me and know of others who have had it as
well. Never figured out what was causing it. Even caled Kantronics.
I was also using RTS/CTS handshaking on a hardware serial port (not
USB).

Kenny,
I understand you, the KPC-3 is programmed as a stand alone digi?

The set up for the digi may be correct, but for UI-View, you can use the Host Mode of KISS under the Comms Setup with 4800N81, select the appropriate com port, then click Setup and select KAN for the initialization.

I uise a KPC-3 non plus with ROM 5.1 as an IGate and works great!

Let us know how it goes,
Stan/KC7EHJ

First... I trust you tryied to disconnect from the station you were connected to.... Being unable to disconnect from the other station suggest that the problem may be with the other station.... the one you are connected to...
Also, try to replace the built in battery if it is a few years old....

To answer some of the fields, the CON light is not coming on and staying on, and I am not actually trying to connect to other stations. I am just wanting to bring up UI-View and monitor mainly.

I think today I will solder a new DB9 connector for the back of the TNC just to be sure all connections are fine. IT's so hard to diagnose this problem right now, being that it is summer and VHF is crappy through most of the day. Right now, I am monitoring, and see nothing on my APRS screen other than myself.

There's an organization that gives you the option of building one
yourself or getting the appropriate connectors for the do-it-yourselfer
crowd. See http://www.pfranc.com . They have an unorthodox business
model (you'll see!), they have great products and service. 73

Do you have a penchant for something that you'd like to write about? Contribute your passion in crafts at koonji.com . It's a free site where you can write about your passion.

Contribute about your expertise in crafts and write about your knowledge in your hobby. It'll benefit all those who share the same passion as yours. Koonji allows you to share, organize and enhance every kind of information in a step by step how-to guide. It redefines the way people search for and use information on the web. It's a great way to educate others about anything and everything.

4354. compiling aprsd on FC3 (irlp version)

Yahoo group: APRS (2007 — 2010)
Date: 2007-07-12 16:33:28 UTC
From: Greg
Topic: 4354 Message: 4354

Hi all,

I'm compiling aprsd 2.2.5-15 on a FC3 i386 system and configure
gives the following error:

checking for C++ compiler default output... configure: error: C++
compiler cannot create executables

My Debian system doesn't have any problems, but then again it has
the full source, whereas the system that I'm using now is the
stripped down IRLP node version on FC3.

I've had to run yum to install gcc, etc. ...

Any ideas?

Greg VE9GFI

Here is the relevant looking data from the config.log

gcc is for compiling C programs. g++ is for compiling C++ programs.
If configure is looking for g++, you need it for at least part of
your compile.

Having fun yet? This is pretty esoteric stuff, so perhaps we should take it to private mail instead of the list. Unless the list members want to learn details of C/C++ compiling/linking on linux... Somehow I think that's doubtful. ;-)

> g++ -g -O2 -Wall -pipe -pthread -o aprsd aprsd.o aprsString.o

> lcrypt -lpthread

Ok, you've got several of the source files compiled now into *.o files, and the above command is attempting to link them all together to create the executable. Great so far!

> httpserver.o(.text+0x18eb): In function `buildPage
> (std::list<std::basic_string<char, std::char_traits<char>,
> std::allocator<char> >, std::allocator<std::basic_string<char,

> /usr/lib/gcc/i386-redhat-
> linux/3.4.4/../../../../include/c++/3.4.4/iomanip:214: undefined
> reference to `convertUpTime(int)'

Ok, it looks like this file is referencing the function "convertUpTime", but the linker is not finding it to link to:

/usr/lib/gcc/i386-redhat-linux/3.4.4/../../../../include/c++/3.4.4/iomanip

Which really turns into this path due to the ".." entries:

/usr/include/c++/3.4.4/iomanip

Confusing huh?

It looks like line 214 of that file references it. Best I can suggest is look at that file (probably a *.h file?) to see if that's where it is being referenced from, then perhaps look at any #include statements earlier in that file to see if files that it includes are missing on your system. Also, were there other warnings that passed you by earlier in your compile? It's possible that they went by and you missed them, but they might give you additional clues as to what is going on. I suspect you're missing some libraries that the C++

compiler needs.

On my OpenSuSE Linux systems I usually add the "colorgcc" package,
which does what it sounds like: It colors warnings and errors
bright red or blue when compiling/linking so that they're much more
obvious. That's if your xterm is capable of displaying color.

Again, let's take this to private e-mail next go-around, or you
could take it to an aprsd-specific mailing list or some GCC or
linux-development type of mailing list if I run out of ideas. I do
mostly C stuff (Xastir and similar), so this C++ coding/linking may
get beyond me at some point.

I am trying to cleanup our APRS network.

I have 3 Digis in a triangle about 10 miles on a side.

The Igate is using an old Icom 2AT to communicate to Digi-1.

Digi-2 & Digi-3 can only get to the Igate via Digi-1.

I need recommended settings for each.

Igate (UI-View - MFJ 1278)

Digi-1 (D700)

Digi-2 (MFJ 1278)

Digi-3 (KPC3)

Thanks

zip code, like mine (N-1680), to return repeaters or digis in our
vicinity? Never heard of it.

There is one site I remember, but it only shows linked systems or multiple stand alone repeaters owned by a group or club. I checked for within 100 miles of my zip code and it missed many of them. There may be a better site available somewhere. Here's the URL: http://www.repeaterlink.org/

Here are a couple that you can pick a state and get a list of
repeaters by city or frequency.
<http://www.artscipub.com/repeaters/>
<http://www.usrepeaters.com/>

For APRS here is one that has search forms that includes
zipcodes.

IIRC the web site(s) were very much a work-in-progress and they were asking people to come register their repeaters, rather than trying to enter information from other sources. Your best bet is to find out the repeater co-ordination authority for that area from the ARRL. They will have an actual list of co-ordinated repeaters, which will be a pretty complete start in many cases. Or, of course, the ARRL's repeater guide.

Finally - A spam blocker that actually works.

The official position sending at sea is called AIS.

As an example you can check http://www.goranpettersson.se/
which is the a page from SM0HXB, which receives the AIS-info
by radio, and show it on Internet.

A friend of mine modified a radioscanner, and then uses the
free software "SeaClear" to get the AIS plotted on a chart.

4369. Decoding APRS paths

Yahoo group: APRS (2007 — 2010)

From: FlyinDoc
Topic: 4369 Message: 4369

Can someone direct this "APRS newbie" to a reference for decoding the path strings in raw aprs packets? I found one page listing the assignments for the AP**** codes, but the info I need is even more basic, as in what station heard it first and what is the significance of the WIDE-1 and other text appended to the call signs of the relaying stations. (I know about specifying WIDEN-n paths in my tracker, but I'm wanting to learn to decipher how the network has handled my beacon's UNPROTO packets on their way to the IGates.) Thanks.

-Bill Boyd / N4DLN

4370. AIS is What the "Marine APRS" is.

APRS is Automatic Position Reporting System originally developed by Bob Bruninga. It's a communication network used by AmateuGervais-
You are thinking of the "AIS" system

Check out www.coaa.co.uk/shipplotter.htm or www.shipplotter.com to see the software that will let you do this. They mention that you will need a VHF radio with a direct discriminator output, that tapping the audio will not be good enough. Let us know how it works if you try it.

Find out how you can get spam free email.

Just to clarify, here's a cut-and-pasted example of the type of data
I'm trying to decipher, taken from a pop-up balloon on the
aprs.he.fe.fi page:

SVSW9U via WR4RC-3*,W4FXO-4*,WIDE2*,qAo,AF4MS

Where can I read up on what exactly all this means?

TNX,

-Bill

I don't know of a definitive reference on the subject, other than the AX.25 spec. The digipeaters appear in the order in which they were used, with the * showing that they *were* used. The 'q' construct qAo tells how it got onto the Internet. I forget what they all mean, but it does tell you that the next call, AF4MS, was the IGate.

Hi All,

I am just getting started in APRS. I am starting with basicly nothing. I have been trying to play around with the different programs and get a feel for what I need to use APRS. I know the basics that I need a radio tnc gps, but how do I get it all working. I know this is a very general post, sorry about that but I have been racking my brain on trying to get a setup going. Possibly could some one tell me a current set up they have up and going that works good for them. I am willing to try about anything just so I can get APRS working. Thanks

Tell us what you'd like to do with APRS. For instance, do you want
to run it on a desktop, a laptop, a PDA, or computerless? Do you
want to run at home, in the car, portable, airplane/boat/balloon
mobile? What operating system if using a PDA or computer?

Do you need maps? If so, what type? Topo? Street? Aerial images?

Do you want to do radio direction finding with APRS? Weather
alerts? Run your own weather station and transmit its data?

There are many ways to run APRS. Some cheap, some expensive. Some
complicated, some not so much.

Also: Are you capable of building kits and cables, or do you want a
ready-made or near-ready-made solution?

Thanks for the quick response. I would like to have a base station at home hooked to a desktop computer. The next one I would like to do is a mobile hooked to a Pocket PC. For the pocket PC I have installed APRS/CE on my Dell Axim x51 but I would like to have the street maps for it but I cant find them any where. I have never built kits but with a set of schematics and instructions I am positive I can do it and I have built up cables from scratch before, for IRLP, actually I enjoy it a little bit. Thanks again

You didn't specify the OS, so I'll assume Windows (since most people run it, although I personally don't). Go download/install UI-View. That's the easiest to get started with for Windows and is fairly full-featured. There are lots off add-ons for it as well. I encourage you to follow the license terms and donate to a cancer research organization. The author of that program passed away a while back from cancer...

Can't help you directly there, unless it handles PocketAPRS maps (PocketAPRS is for PalmOS, no longer developed or maintained) which it might. You can find them in various places on the 'net. Henk de Groot has created some for parts of Europe. I have a few for my part of the U.S. as I have a PalmOS5 PDA, plus Xastir can also use PocketAPRS map format and I run Xastir.

> I have never built kits but
> with a set of schematics and instructions I am positive I can do it

Ok. For a desktop you have a few choices:

*) Internet connection.
*) Radio connection.
*) Both

If you run both, you can function as a local igate, gating packets between the internet and RF. Gating RF->Internet is almost always a good thing. Gating in the other direction may depend on who's already serving your local area and how well they cover it. Generally the only messages that make it from INET->RF automatically are messages and message acknowledgments (ACK's).

Now, if you want to run RF, you'll either need a TNC hooked between a serial or USB port and your radio, or you might be able to use your computers soundcard as the TNC. Check out the "AGWPE" package for this capability.

If you choose to use a hardware TNC, you can choose a full-blown one like the Kantronics KPC-3+, or you can go with something like the John Hansen TNC-X with either a serial or USB port. I personally am using the TNC-X off a serial port. You can also use much older TNC's like AEA PK-88's and PK-232's, MFJ or TAPR TNC-2's and clones, etc. If you wish to go mobile with your TNC and/or connect a laptop while mobile for mapping, then your choices narrow down a lot.

There are some new TNC's in development that are awfully cool and should be quite low in price compared to some of the other commercial offerings. I'm speaking of the TinyTrak4 and the Tracker2. There's also the OT1+ which is also capable of some receive capability, but I don't think you can use it as a general TNC.

There are other options, but that should get you started and asking more detailed questions.

FWIW: My home system is a TNC-X (very inexpensive kit) connected to an OpenSuSE (free) Linux box (old PP200 PC) running Xastir (free) and an old 2m Kenwood mobile radio (hand-me-down from my bro-in-law).

My Jeep setup is a Kenwood 50W 2m mobile rig bought on sale (running medium power), a Radio Shack DigiTraveler (Sony) bought on closeout for $30, and an OpenTracker-1 (very inexpensive kit).

I plan to switch to a Tracker2 sometime soon for the Jeep, which will then allow me to pop a computer into the setup at any time for mapping/messaging without disturbing my normal Jeep tracking parameters. I'm a beta-tester for the Tracker2, and was a beta-tester for the TinyTrak-I and II a long time back. All good devices. TinyTrak-3's and OpenTracker-1+ are the currently sold models from the respective companies.

From: Mark Crosbie
Topic: 4378 Message: 4378

I have a question that I cant seem to find an answer too.
In the APRS software it ask for the antenna height. Is the antenna heght figured as feet above ground, or feet above sea level?

When I display the coverage circle in the APRS software the feet above ground circle just does not cover the area that I know that I can hear direct.

I see that some station list their height above ground, others list height above sea level. Which is correct?

Mark

I believe it's height above average terrain. Ask on the APRSSIG and
you'll get at least 3 different explanations of how to calculate that!

For a station on relatively flat ground, I'd say you just want the
antenna height. It probably only matters if you're calculating for a
mountaintop digipeater or something.

This is used to calculate your range circle, so height above sea level
is meaningless unless you live by the sea. This should be height
above average terrain.

> When I display the coverage circle in the APRS software the feet
above ground circle just does not cover the area that I know that I
can hear direct.
>

First of all, you need to understand that the range circle is a
calculated approximation, the real world will always be different.
Second, remember that another station with a range circle that
intersects yours will probably be within range, even if it is outside
of your circle alone. Third, if your range circle needs adjusting,
you can fiddle with the PHG values in an attempt to bring your circle
closer to reality.

> I see that some station list their height above ground, others list
height above sea level. Which is correct?
>

You shouldn't use height above sea level unless is is the same value
as height above average terrain. Height above ground is not the best
answer either unless it is flat where you live.

Should be height above ground.
(Could then be used to estimate the propagation distance
from the antenna, for example by extra SW modules to the
APRS program UI-View32.)

Hi I am starting a group to build / port HAM Radio Applications to the Nokia N800 http://groups.yahoo.com/group/HildonHam/

I am planning to start this by porting APRS.

If anyone here has a Nokia N800 or 770 internet tablet or is just interested in helping out please join in. So far I am just investigating ideas.

"Everybody knows" that VHF RF follow the line of sight - in reality
it's a little more, even on pool-table-flat terrain. In hilly/mountainous
terrain you get reflections and refraction over the tops of the peaks,
especially ridgelines.

In your case I'd run your numbers through Dale Bickel's HAAT
calculator <http://www.fcc.gov/mb/audio/bickel/haat_calculator.html>
and see what it says.

BTW, use the NAD83 numbers - and here's why:
<http://www.repeater-builder.com/antenna/where-is-my-repeater.html>

And don't forget that the height of the antenna is not the same
as the height of the radiation pattern. From the above page:

"How High? There are two height figures associated with antennas,
and they are not the same. When the FAA and FCC ask for antenna
height, they usually mean the top point of the antenna radome or the
mast, whichever is taller. This height establishes the minimum
clearances for air navigation. The other height figure is the height of
the antenna's radiation center, or "RC". The RC height is used to
perform propagation studies and to calculate the Height Above Average
Terrain, or HAAT. Usually the RC is considered to be the physical
middle of the antenna, but it's not always."

While it's an extreme example, I've seen a pair of DB208s stacked
on a tower (each one is 41 feet long) and driven by a 2-port splitter.
The RC of that pair is the middle of the two.

4385. UIView Objects

Yahoo group: APRS (2007 — 2010)
Date: 2007-07-26 14:11:11 UTC
From: Ray Brown
Topic: 4385 Message: 4385

Hi Everyone,

I had objects on my UIView and unchecked the box "Active" to turn off the object with the intent to activate at a later time. But, now I can not find the objects. Are they hiding in a file somewhere or do I have to define them again. Since the feature has a delete key, I had no idea that unchecking the active box would delete the object. Any help on this subject would be great.

Hi all,

I live in Kodiak Alaska. I am wanting to get into aprs and am almost there. I have all my equipment on order to get the station set up for both mobile and a base at home. But I am having a hard time finding maps for Alaska. Does any one use aprs in Alaska. Do you know where or how I can make maps for Alaska? Thanks

WinAPRS can use Tiger/Line data now I think, so check out their docs
for that. That should give you up-to-date street maps.

You can also use original APRSdos and WinAPRS vector maps, and there
was an Alaska state map. You should be able to find it with Google
easy enough.

UI-View uses raster maps as I recall. There's a mailing list for
UI-View users where you could ask, plus the download and info sites
for UI-View have points to map sites.

I think APRSce can use PocketAPRS maps and you might be able to find
one of those for Alaska still. A lot of the PocketAPRS maps
disappeared when the developer stopped the project and took his site
down. I don't know what other map types, if any, APRSce can use.

Brian, what happnes during the crash?
And have you tried running it in compatibility mode? Are you familiar with the compat. mode selections in XP?

> WinAPRS can use Tiger/Line data now I think, so check out their docs
> for that. That should give you up-to-date street maps.
Be careful with TIGER maps, they are specifically NOT intended for navigation. Their purpose is to show "a thousand people live on Jones Street" not precisely where that street may be--according to their makers.

Free pop3 email with a spam filter.

I use UIView32. I also use TOPO 5 from DeLorme. I make my own maps for what ever area I need. If you end up using UIView and dont have TOPO or Street Atlas or Microsoft Streets and Trips I could make some maps for you if u use UIView.

Brian-
Try reading this for a start:
http://www.microsoft.com/windowsxp/using/helpandsupport/learnmore/appcompat.mspx

Unless something has changed recently in WinAPRS, it should run without problems. It was a well-behaved DOC program and those run without incident in XP. If the compatibility wizard doesn't solve your problem, you might try to contact the authors or other uses to check into what could be killing it with XP.

Finally - A spam blocker that actually works.

4403. SeaPort Equivalent of APRS

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-05 22:07:05 UTC
From: genied7
Topic: 4403 Message: 4403

About two weeks ago, one of the members asked about something equivalent to APRS for viewing and tracking ships near ports.

A responder advised that the AIS system is probably what to look at. Indeed, it is a system very similar to the APRS activity.

For those who live close to deep water ports, I suggest the SR161 AIS receiver available with decoding software from Milltech Marine.

While you can probably hook up the data port on your ham transceiver (e.g. Icom 706 or 746 generation transceivers) and use available free AIS software, the SR161 eliminates tying up the ham transceiver when one desires to enjoy watching what is going on in a busy port on a more or less full time basis.

Other AIS equipment is available for those who would like to survey all of the vendors. Just "google" AIS and ignore the "insurance company" recommendations.

(e.g. Icom 706 or 746 generation transceivers) and use available free
AIS software, the SR161 eliminates tying up the ham transceiver when
one desires to enjoy watching what is going on in a busy port on a
more or less full time basis.

Other AIS equipment is available for those who would like to survey
all of the vendors. Just "google" AIS and ignore the "insurance
company" recommendations.

4405. SiRF Star III receivers for $50

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-07 22:47:35 UTC
From: Scott Miller
Topic: 4405 Message: 4405

The new SiRF Star III-based receivers from Deluo work great - they're way more sensitive than the older Sony units - but apparently the factory screwed up on the latest shipment and put male mini-DIN connectors on them rather than female.

This means that they won't work with any of the adapters, but the receivers are still perfectly good. I've got around 50 on hand right now, and instead of shipping them back for rework I negotiated a price reduction on them and I'm selling them at the discounted price of $50 each.

If you don't mind a little soldering to get it to a usable connector, this is probably the best deal you're going to find on these things. For tracker purposes, you can wire up a female DB9 with green -> pin 2, red -> pin 4, and black -> pin 5.

4406. O/T about the ISS and Packet

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-11 02:20:09 UTC
From: gervais
Topic: 4406 Message: 4406

yes it is O/T,,,,may i have an answer please

is there still some activity on packet on the ISS

on what frequency if there are activities??

thanks for the tolerance

gervais ve2ckn

she is just passing over my qth,,,,,,,,bye going outside to look at her

4407. TNC2 and APRS?

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-12 04:13:59 UTC
From: kd7skx
Topic: 4407 Message: 4407

Hi all,

I just got two tnc's and wanted to see if they would work for aprs. The first one is Kantronics Packet Communicator II KPC-2 and a GLB TNC2-A. Will these work for APRS. Thanks

Brian

4408. New Data Base Here

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-12 03:09:53 UTC
From: Eric Rademacher
Topic: 4408 Message: 4408

Hi,

I'm looking for a GPS unit that will work with APRS, display data
from other stations and have all the bells and whistles like giving
directions audibly.

To help in locating such a unit I created a database in this group.
I am asking that everyone willing to help enter the information they
have regarding the GPS units they use.

It is an open database so I or the moderators can change the format
if other columns need to be added.

Please help,

Thanks.

4409. KPC-3 Plus Question

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-12 04:47:15 UTC
From: rrath@charter.net
Topic: 4409 Message: 4409

Here is what I have:

KPC 3 Plus, Garmin eTrex, an older laptop computor and an Alinco DR-112
2 meter radio.

This is what I would like to do:

Have an APRS station in my RV during our vacation. Will these items do
that? Is one frequency good nation wide? If so, what frequency would that
be?

Thank you
Rod

Even though the info.aprs.net Wiki site is getting hammered by
spammers, there are still GPS pages there that need filling in.
Perhaps consider filling them in instead of starting an entirely new
set of pages?

<http://info.aprs.net/wikka.php?wakka=Hardware>

I believe the long-term plan is to replace that Wiki software with a
more secure version.

Hi Eric,

I could not figure out how to add the information, so here is some information for you. You can check out the WEB Site for these units. Also, Yahoo Groups are established with some additional Information.

GPS Brand - AVMAP
Model - G4T (2005)
APRS Yes
Other Stations Yes
Comments: 5 inch Color Screen, Diag - 3 inch by 4 inch
Choice of Multi-Lingual Voices for Turn Directions
Compatible with D700 and D7, interconnection cable provided
User Programmable POIs, as well as Installed POIs
5 User Identifiable Setup Boxes, with 31 Choices
Distingushes between Stationary and Moving APRS Stations
Intercept to Target (ITT) capable (Navigate to Targeted Station)
TeleAtlas Maps for all the United States - Canadian Maps on CD
Periodic Firmware Updates available from AVMap for Registered Users

GPS Brand - AVMAP
Model - G5 (2007) - Brand New, Available Now at AES, HRO and others.
APRS Yes
Other Stations Yes
Comments: All of the Above (Plus)
Touch Screen Capabilities
Latest/Newer United States Maps

I have been using the G4T since it hit the market and am one of the Moderators for both of the Yahoo Groups - I do not have a direct interest in AVMap nor the distribution of these GPS Units within the United States. What drew my interest to these units was its Large Screen and the ability to display other APRS Stations. My activity as a Moderator has led me to believe that AVMap is continuing to improve these GPS Units for use by the Amateur Radio Operators. I am looking forward to purchasing the new G5 and the Kenwood D710 in the very near future.

From: Ron Tonneson
Topic: 4409 Message: 4412

Rod,

I think that I am correct that the eTrex has a serial NMEA output. You can feed that to your
KPC-3+ and connect the KPC-3+ to the DR-112. With proper setup in the KPC this will provide position reports. You only need to use the computer to initially set up the KPC unless you want
to have a map display.

In the USA 144.39 MHz will work everywhere. You will want to use a path of WIDE1-1,WIDE2-1 for
most areas. In very rural areas you could go to a path of WIDE1-1,WIDE2-1.

4413. RE: [APRS] New Data Base Here

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-13 18:01:55 UTC
From: Ed Sack
Topic: 4408 Message: 4413

I'll not name specific manufacturers for obvious reasons but I have found a significant difference in the satellite signal sensitivity between GPS units. Those differences may not be significant on the open road if the unit has a clear view of the sky but if there are obstructions in the path they can become important. I have used these units in land based service, marine service and while traveling on commercial aircraft.

Of the four units I use regularly, one captures the essential satellites at all times of the day very quickly. Important when making adjustments or want to get underway quickly. One, at the other end of the scale, is very fussy, sometimes requiring minutes to capture the essential satellites and sometimes losing the satellite capture at just the time I want it to be most "on the ball."

One of the four units has an external satellite antenna which clearly gives it an edge in cases where the unit itself has to be mounted with less than an ideal view of the sky.

Name brands and price do not tell the entire story.

It's hard to generalize even for a single manufacturer. There's a big
difference between the Garmin GPSmap 60CS and the 60CSx. The latter has
a SiRF Star III chipset and does a lot better indoors. I'm still happy
with my 60CS, though.

Any of the SiRF Star III receivers seem to work well. I don't know what
else on the market right now would be comparable.

Jim,

Before I just go off and enter the info, would you try the following? I would like to know if others would be able to enter data.

Go to Databases in the yahoo group

Double click on <http://groups.yahoo.com/group/APRS/database?method=reportRows&tbl=1> GPS Compatiblity Chart

Then click on Add Record

Please let me know if this works for you.

4420. Will Pacom Modem work?

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-13 20:49:00 UTC
From: kd7skx
Topic: 4420 Message: 4420

I found one of these guys cheap and was wondering if it would work for aprs or not. Any one ever used a Pacom modem before? Here is the link. http://www.paccomm.com/ewm.html Thanks

Brian

4421. Re: [APRS] Re: New Data Base Here

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-13 23:49:36 UTC
From: Jim Keck
Topic: 4408 Message: 4421

Tom,

Please clarify your suggestion a bit further. A GPS unit may have both USB and Serial Interface. For instance, the
USB interface may be used between the Computer and GPS strictly for updating the GPS with Firmware or Software. Whereas,
the Serial Interface, albeit, 2 or 3 wire, (tip-ring-sleeve connectors) are used to transfer data to/from the GPS and Radio.

Jim - N6JIM

4423. Re: New Data Base Here

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-14 14:01:20 UTC
From: Tom
Topic: 4408 Message: 4423

In the case you describe, Jim, I think a 'Y' would go in each column labeled 'USB' and 'Serial'. Most GPS units, I think, have either USB or serial, but not both. That info can be helpful to someone who wants to interface to a computer with no serial ports (most of the newer computers). In that situation the person could decide whether or not they wanted to also purchase a USB-to-Serial adapter.

A related question: Would a column indicating whether or not the GPS could output data in the NMEA 0183 standard be useful? That standard is required by most, if not all, APRS sofware and so would make a big difference if the person is choosing the GPS for APRS use. I realize that there's already a column labeled 'Does it work with APRS (Y/N)' but I can see where the answer there could be have lots of "if you add this, etc" associated with it.

Last....Eric, how can I modify my database entry to add the data in those new columns?

Tom

4424. RE: [APRS] Re: New Data Base Here

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-14 16:32:49 UTC
From: Eric Rademacher
Topic: 4408 Message: 4424

Tom,

I agree, we will reach diminishing returns. It looks like I have 10 fields to use. I've added NMEA 0183. That leaves one more.

Eric Rademacher

From: APRS@yahoogroups.com [mailto:APRS@yahoogroups.com] On Behalf Of Tom
Sent: Tuesday, August 14, 2007 9:01 AM
To: APRS@yahoogroups.com
Subject: [APRS] Re: New Data Base Here

In the case you describe, Jim, I think a 'Y' would go in each column labeled 'USB' and 'Serial'. Most GPS units, I think, have either USB or serial, but not both. That info can be helpful to someone who wants to interface to a computer with no serial ports (most of the newer computers). In that situation the person could decide whether or not they wanted to also purchase a USB-to-Serial adapter.

A related question: Would a column indicating whether or not the GPS could output data in the NMEA 0183 standard be useful? That standard is required by most, if not all, APRS sofware and so would make a big difference if the person is choosing the GPS for APRS use. I realize that there's already a column labeled 'Does it work with APRS (Y/N)' but I can see where the answer there could be have lots of "if you add this, etc" associated with it.

Last....Eric, how can I modify my database entry to add the data in those new columns?

Tom

4425. GPS Compatibility databse. Update

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-14 16:35:56 UTC
From: Eric Rademacher
Topic: 4425 Message: 4425

All,
I have changed the rights to allow anyone to edit an entry. that way
if columns are added you can go back and update entries.

Eric

4427. Cleaning up the APRS network

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-14 17:24:34 UTC
From: Rod Bartlett
Topic: 4427 Message: 4427

I am trying to cleanup our APRS network.

I have 3 Digis in a triangle about 10 miles on a side.

The Igate is using an old Icom 2AT to communicate to Digi-1.

Digi-2 & Digi-3 can only get to the Igate via Digi-1.

I need recommended settings for each.

Igate (UI-View - MFJ 1278)

Digi-1 (D700)

Digi-2 (MFJ 1278)

Digi-3 (KPC3)

Thanks

Rod - N8QVR

Please specify which program. There are quite a few APRS programs.

From: Jim
Topic: 4432 Message: 4433

If you apply the links to put power on pin 7 of the radio port, you can get 12v but not 5v. How about a regulator in the GPS plug?

Pin 7 is normally for power in, but if you power the TNC via the normal plug the pin is just on the common power rail.

I'm going to chime in here and say that a KPC-3+ isn't really an ideal tracker. It's also a bit of a waste for a $180 piece of hardware. A purpose-built tracker like my own OpenTracker+ or the Byonics TinyTrak 3+ will work better as a tracker (with SmartBeaconing and smaller packet sizes) and will also provide regulated 5 volt power for the GPS receiver.

Save the KPC-3+ for a digi. Or sell it on eBay and buy 5 OpenTrackers. =]

4435. Re: [APRS] Re: New Data Base Here

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-14 22:35:09 UTC
From: Jim Keck
Topic: 4408 Message: 4435

Tom,

That is were the confusion lies - The USB Port on the GPS units that
I have run into are NOT to be used to provide the computer with NMEA 0183
data - Their only function is to provide a computer input to the GPS for
Software Updates.

I attempted to clarify that in the data base entries that I added. It is
difficult to simply say 'Y or N' and you are quite correct in that some of the
latest GPS units do not have a NMEA 0183 output. Even fewer GPS Units
accept data from a Receiver and Display that information.

There are many different type of data strings in addition to NMEA 0183.
Also, there are a variety of different connectors on GPS units and Radios.
In order to cover all a database could have many columns.

Jim

4437. Re: New Data Base Here

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-14 22:47:43 UTC
From: Tom
Topic: 4408 Message: 4437

Right you are on all points, Jim. I think Eric's original intention with the database was to show a brief overview of GPS capabilities, particularly as they relate to APRS. That would seem to me to be a good starting point where some GPS units could quickly be eliminated from consideration. Remaining models could be investigated elsewhere.

Tom

4438. RE: [APRS] KPC-3+ GPS question

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-14 23:14:36 UTC
From: Dakota Summerhawk
Topic: 4432 Message: 4438

I do have a Bluetooth GPS that I may be able to use with an USB adapter for the data but don't know if WINAPS would support that.

Ah. I've done that with a TK-790, but not the TK-760 and I don't know
how the accessory port compares.

Scott, there isn't an accessory port on the 760, its run directly into the mic jack on the front, this radio is for nothing other than APRS. 25W out and I have one other (50W) model for voice in the car. They both work great.

Really? I thought it had a DB25 or something similar like the Series 90
radios. I've got a commercial customer using them with OpenTrackers in
India, and I thought they had some sort of accessory port.

Oh well...

From: Jim
Topic: 4432 Message: 4444

Are you wanting to pull the GPS data into the PC?

If so, connecting to the second UART on the radio port won't achieve this as it's purely for use by the TNC in tracking INT GPS mode. There is no pass-through.

Great, is there a way to get the gps data into the mix without spending $300 for a new tnc? This project is getting to be more hassle than its worth for a working mobile aprs station. I have been told that the KPC-3 + could have the GPS connected to the DB-9 along with the radio and have the data stream in from that port and still use the computer on the DB-25. So was that wrong or am I just going to have to spend the money to get a dual port tnc to do this with?

Dakota,

If your KPC3+ is version 8.3 or newer, you can connect both the radio and the GPS to the DB-9 port by building a custom "splitter" cable. The PC connects to the DB-25 and the TNC will send the GPS data to the PC when the APRS program on the PC asks for it. This works great with UI-View32, I don't know about WinAPRS. I have run this config in my van (with UI-View32) for years.

The pinout for the splitter cable is in the KPC manual. I can send you a MS Word diagram if you send me your email address.

"when the APRS program on the PC asks for it". I think that's
called Control-E or PicoPacket mode, where the PC sends a Control-E
character to the TNC and the TNC sends back the most recently
captured GPS string(s). Xastir has support for this mode as well,
and I think PocketAPRS does too. As far as I know it was originally
implemented on the Paccomm picopacket TNC. I have one of those
around somewhere.

> The pinout for the splitter cable is in the KPC manual. I can send you a MS
> Word diagram if you send me your email address.

Yet another way if your program doesn't support Control-E querying
of the TNC would be to run the DATA OUT line from the GPS into the
TNC _and_ into another serial port on your computer. Just don't
connect the DATA OUT from the COMPUTER _and_ the DATA OUT from the
TNC to the GPS at the same time. Hooking up one or the other of
these is fine, just not both.

4450. Paccomm modem as Digipeater

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-15 19:15:56 UTC
From: ip_radio
Topic: 4450 Message: 4450

Hey!
I'm new in this group.
I'm trying to build a DIGI using an old TNC from Paccomm, this is a Tiny-2 tnc.

Now i do several test with it and for some reason when the remote station respond to the digi, it didn't repeat this packet.

So i'm looking for some info and Cmd's to setup this TNC like an APRS digi.

Best Regards!

Here's the tnc-startup.paccom file from the Xastir distribution. It
should give you some ideas:

```
-------------------------------------------------
# This is the TNC Startup file for a Pac-Comm TNC with v5.x
# firmware.
# Adapted from Kantronics startup file by Kurt Freiberger, WB5BBW

# lines that begin with a pound sign are comments.

HID off
#CWID every 0
MON 0
ECHO off
#MYCall WB5BBW
#
# Important! Only uncomment if really needed as a fill-in digi:
#MYAlias WIDE1-1
#
#
#
#MY1Alias LOCAL
#MY2Alias REGION
#MY3Alias WORLD
#
# B E 0 must be set to 0 or both APRS and your TNC will send BCNS
# Which will alternate in everyones L and A lists and fill up

4452. aprs packet string question

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-16 01:10:50 UTC
From: Mark Crosbie
Topic: 4452 Message: 4452

What is the difference between the <UI>, <UI C> and <UI R> that I see in the history strings on my APRS software?

[Non-text portions of this message have been removed]

Try this link:

<http://www.tapr.org/pub_ax25.html>

Which takes you to the AX.25 specification.

I used to be quite familiar with a lot of it, but that was too many
years ago.

As I recall the "UI" means Unconnected Information frame. UI
packets are what are used for APRS, in other words there's no
connection happening between the endpoints.

I don't remember off-hand what "UI C" or "UI R" would mean, but
glancing at the spec should give you some hints.

I think they're the 'command' and 'response' bits, which IIRC don't
really mean anything in the context of APRS.

So lets see if I get this right.
<UI> is a general packet sent out by an aprs station

<UI C> is a outgoing packet that a stations sent that contains a command

<UI R> is a incoming packet with a response to the command that was sent out

I think they really only apply to S frames, and not to UI frames. The
only meaning I can see that they might convey, according to the spec, is
to identify the AX.25 protocol version.

Nothing in the APRS world should care which of these bits are set.

4458. APRS Wiki

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-17 18:51:36 UTC
From: Scott Miller
Topic: 4458 Message: 4458

The new Wiki is now live at http://info.aprs.net. The old one has been made read-only (I hope) and archived at wiki.n1vg.net for reference.

It still needs a good corner logo. If anyone's got one, let me know and I'll post it.

I'm much happier with the MediaWiki software. And no spam, so far. I've got it locked down to require email authentication before you can make any changes. Hopefully that won't be a problem for anyone.

Remember that any outside links that refer to info.aprs.net pages
will have to be tweaked, as the paths to the internal pages have
changed slightly.

For instance:

<http://info.aprs.net/wikka.php?wakka=SmartBeaconing>

is now:

<http://info.aprs.net/index.php?title=SmartBeaconing>

If you lost a page that you used to link to (one or two pages got
renamed when they were moved to the new Wiki), do this:

<http://info.aprs.net>

Click on Toolbox->"Special pages"

Click on "All pages"

It'll show you a listing of every page in the APRS Wiki.

What is your screen resolution and color level on your laptop? I would presume
you need the 1024 x 768 and at least 16-bit color.

Date: 2007-08-20 09:29:31 UTC
From: compwhiz80
Topic: 4466 Message: 4466

Hello all.

I'm new to the whole APRS thing and would like to set up a system that receives weather data from area stations and log it to a webpage or display it on an image. Is there something out there now that does it? I currently just want to receive and then maybe later one work on transmitting after I get my license next month.

If there is something that will do reception only and will display the weather alerts compatible with the AGW Packet Engine that would be great. I currently have a Motorola Maxtrac 100 with the discriminator tapped running into my soundcard on the PC with the packet engine running. Data seems to be coming in good as I have the AGW Terminal running and it all seems to be showing up.

Any help would be greatly appreciated!

-Adam

There are several APRS clients that can talk to AGWPE. Just don't
hook up the push-to-talk (PTT) to the radio and you'll have a
receive-only configuration.

See my web page below (first link) and click on the APRS Client
Capabilities Chart to get a quick look at what APRS clients can do
what. AGWPE is one of the rows listed (under the "TNC's" heading).

Rod,
Try right clicking on the APRS icon on the desktop. Then click on properties. Go to the program tab and under the heading "Run", select "maximized". Then click Apply and OK. That should do it.

Good luck
Eric 9Z4CP.

This is the best I can do for you:

<http://www.xastir.org/wiki/index.php/HowTo:Ubuntu/Debian>

But perhaps a Debian user or two will speak up.

> Once I have done that; How do I configure the software to communicate
> with the Kantronics TNC?

My preference is to put the TNC into KISS mode and then in Xastir
set up a "Serial KISS TNC" interface under the "Interface->Interface
Control" menu. I'm currently running a TNC-X (KISS-only TNC) under
Xastir using the Serial KISS TNC interface, using OpenSuSE-10.0
Linux and Xastir-1.9.1 (CVS).

Another way is to set up a "Serial TNC" interface from the same
dialog and then set the Interface->Properties for it to use
"tnc-startup.kpc3" and "tnc-stop.sys" for the two files at the
bottom of that dialog.

> What's the difference between Source and Binary? Educate me, oh
> great one...hi hi.

Sources are uncompiled code. In other words, the text files containing 'C' code that the developers check in to the archives. The computer can't run source code. Binaries are compiled source code, and the computer _can_ run these directly, _if_ they match your particular OS, OS-version, and installed libraries (and versions).

Those of us that like to keep up with the developers usually choose to install from sources, specifically the CVS sources. This lets anyone update to the latest-latest that the developers have checked into the archives, then with a few commands, compile it and install it. Restart the application and you're running the newest one (anonymous CVS sync's up to the developers CVS archives every few minutes).

Now... If you don't want to install from sources you _may_ be able to find binary versions that you can run. They generally need to match your particular OS very well else they won't work (another good reason to instal from sources: they can be _made_ to work on your system).

So, apt-get on a Debian or Debian-based system may get you a binary, but it may not be the latest either.

Yet another alternative is a "universal" Linux binary, called a "Linux Standard Base" or "LSB" binary. I typically put new ones of these out when I put out each development snapshot, roughly twice a month. You can find these at:

<ftp://ftp.eskimo.com/u/a/archer/aprs/xastir/LSB>

You'll need to install the "lsb" packages from your OS distribution (perhaps "apt-get lsb"?) before you can run this version. You'll need at least LSB-3.0 installed. Keep in mind that this one installs in an unusual place as well, under "/opt/Xastir", per the LSB specifications. Keep that in mind if you decide to use the LSB binary.

One of the nice things about the LSB binary is that most everything needed to run Xastir is statically compiled into the executable, so it depends on those and the LSB packages, making it much more OS and OS-version and library-version independent. It also gives you many

of the most used library options by default.

From the command line "apt-get install xastir" this must be done as root.
Or preferably "sudo apt-get install xastir" also from the command line.
The sudo lets you run a command as root without logging as root. It will
ask for the root password.

From: Frank
Topic: 4469 Message: 4475

Hey!
My name is Frank i'm a Ham radio from Buenos Aires.

I build some days ago a digipeater using a Paccomm tnc, but it didn't support all the APRS functions.

Now, It's possible build an stand alone APRS Digi using a chip modem like a MX614 and a uP?, a pic for example.

Some years ago i build one from TAPR using an 16F84 an external RAM Memory and this MX chip modem.

Best Regards!
Frank

You don't even need an MX614 (though if you do want them, I sell them online. =]) The Tracker2 uses an old style XR2211 demodulator and does all of its modulation in software. The OpenTracker+ does the demodulation in software too, but it's not as sensitive due to processor performance constraints.

4477. Maryland & Eastern Shore APRS Coverage?

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-22 04:43:50 UTC
From: George Helser
Topic: 4477 Message: 4477

In SEP 06, I drove from Gaithersburg MD to Ocean City MD
beaconing APRS. The hardware was a Kenwood D7A with 6W Tx
through a 1/4 wave magmount on the rental car. The APRS coverage
was pretty sparse. I am coming back in SEP 07 and this time I will
have a 1/2 wave magmount on the rental car.

In SEP 06, I was using a path of Wide1-1,Wide2-1.

Would a different path work better?

Thanks!

Regards,
George

26th Annual ARRL/TAPR Digital Communications Conference
September 28-30, 2007
Hartford, CT
http://www.tapr.org/dcc

-- -- -- -- -- -- -- -- --

Announcements:

A total of 18 papers have been submitted for a total of 158 pages. Titles and authors are listed below. Thank you to all the authors! Technical experimentation is alive and well.

A preliminary speakers schedule is being drafted at this time and will be posted this weekend.

Remember to register for the conference. Online registration is at http://www.tapr.org/dcc.

Remember to book your room! The DCC room rates are only good until August 31st. Call the hotel directly and ask for the DCC rates. Hotel information is available on the DCC web side http://www.tapr.org/dcc.

Sunday Seminar:

A Stroll Through Software Radio, Information Theory, and Some Applications
by Bob McGwier, N4HY

The Sunday seminar this year will cover several technical topics. Software Radio will be the main theme and a package of tutorials and give away software will be a part of the seminar. The attendee will be exposed to the basic concepts of and building blocks of a simple software radio system and some information theory exposure will be given. The quadrature sampling detector will be analyzed and why it is such a wonder will be discussed. Its wonderful properties make it an excellent choice for a linear transponder system so its use in the AMSAT software defined transponder will be discussed. Some necessary information theory will be discussed with examples with the goal of leaving the attendee with a working knowledge of the practical use of this theory in thinking about communication systems. Finally, as time permits, we will show some software radio systems from the $30 softrock40 to GnuRadio/USRP doing multi megabit per second OFDM on the air and then a technical description of the Flex5000 and DttSP will be

given.

4484. Global Amateur Radio Emergency Communications Conference at Huntsville Hamfest

GAREC-07

IARU International Coordinator for Emergency Communications Hans Zimmermann, F5VKP/HB9AQS. [S. Khrystyne Keane, K1SFA, Photo]

Almost 100 people interested in Emergency Communications attended GAREC-07, third global Amateur Radio conference focusing on Emergency Communications and the first one held in the Untied States. [S. Khrystyne Keane, K1SFA, Photo]

Army MARS Chief Stuart S. Carter, AAA9A, gives a presentation at GAREC. [S. Khrystyne Keane, K1SFA, Photo]

The third event of its kind, and the first ever held in the United States, the Global Amateur Radio Emergency Communications Conference (GAREC-07) took place August 16-17 in Huntsville, Alabama, just prior to the 2007 ARRL National Convention and Huntsville Hamfest.

Almost 100 people from all over the world came to Huntsville, making this truly a global event. GAREC's prevailing theme, how to apply advanced technologies to emergency communications, was echoed throughout the two-day event. From presentations to discussion groups to emergency vehicle displays to information about the latest in hardware, GAREC attendees had a sampling of just about everything pertaining to the Emergency Communications arena.

According to IARU International Coordinator for Emergency Communications Hans Zimmermann, F5VKP/HB9AQS, "Compared to the first two GAREC conferences [held in Tampere, Finland], the number of international participants was considerably lower. Region 1 [Europe, Africa, the Middle East], was represented by Ireland, France, Bulgaria, Finland, The Netherlands and South Africa. Region 2 [the Americas] had representatives from Brazil, Canada, the United States and Trinidad and Tobago. Region 3 [Asia and Oceania] submitted a detailed report, but sent their regrets due to a collision of dates with a major regional event."

ARRL Alabama Section Manager Greg Sarratt, W4OZK, said many large and essential organizations that work with Emergency Communications sent representatives to GAREC. "We saw representatives from the IARU, ARRL, Army MARS, American Red Cross, Southern Baptist Disaster Relief, Department of Homeland Security, The Salvation Army, industry and others." Sarratt said that organizations weren't the only attendees. "Many Section Emergency Coordinators (SEC), District Emergency Coordinators (DEC) and Emergency Coordinators (EC) from the ARRL field organization attended GAREC."

In addition to those ARRL volunteers and Southeastern Division Director Frank Butler, W4RH, CEO David Sumner, K1ZZ; Chief Technical Officer Paul Rinaldo, W4RI; Media and Public Relations Manager Allen Pitts, W1AGP, and Emergency Preparedness and Response Manager Dennis Dura, K2DCD, attended GAREC on behalf of the ARRL.
Both Pitts and Dura gave presentations. Pitts spoke about the need for a Public Information

Officer (PIO) to be in the Joint Information Center (JIC) at any ARES deployment. "We lose far too many good stories because no one is in the right place speaking to media at the time of the incident. With a 24 hour news cycle, even a few hours later is too little too late. This idea was well received, and while many of the region's groups have recently added this to their action plans, approximately a dozen other groups stated that they will be adding this component to their activities. This information was also well received by some of the international representatives who asked for copies of our PR materials and permission to translate and modify them for use in their home countries," Pitts said.

Dura presented the topic of using VoIP, EchoLink and IRLP for establishing and maintaining communications during hurricanes. The session discussed the methods of combining RF links to the internet to establish a cohesive network. The VoIP Hurricane Net is another tool that Amateur Radio operators, the National Weather Service, the National Hurricane Center and emergency managers use to gather detailed information on local conditions.

Other presentations included the use of new technologies and modes in Emergency Communications, such as ALE, EchoLink/IRLP, D-STAR, Winlink 2000 and TSSG, an advanced system being developed in Ireland.

Outside of the conference venue, various Emergency Communications agencies brought their vehicles. Sarratt said, "An impressive fleet of emergency communications vehicles added a perfect hands-on hardware feel to GAREC. The vehicles were on display and tour for visitors to learn about serious mobile communications." These vehicles, hosted by Alabama Homeland Security, Alabama Baptist Disaster Relief, American Red Cross, The Salvation Army and the Tennessee Emergency Communications Association, were very popular, drawing large crowds. "Luckily, no emergencies occurred to take the vehicles away from us this weekend," Sarratt said.

Lunch was served both Thursday and Friday at GAREC. This lively bunch was from Texas. [S. Khrystyne Keane, K1SFA, Photo]

ARRL President David Sumner, K1ZZ, presents a copy of the August issue of QST (featuring the ARRL 2007 National Convention and GAREC) to Huntsville, Alabama Mayor Loretta Spencer. She said she was pleased that Huntsville was chosen for this global event. [S. Khrystyne Keane, K1SFA, Photo]

One of the many Emergency Communications vehicles on display at GAREC. This one belongs to the Alabama Regional Incident Support Unit. [S. Khrystyne Keane, K1SFA, Photo]

Conference Recommendations
While GAREC is not a decision-making body, its ideas and proposals will be submitted to the IARU to be included for discussion at their next Administrative Council meeting, scheduled for June 2008. These ideas may also be discussed at each of the three IARU Regions' upcoming meetings.
The conference made the recommendation to introduce the call sign suffix "/D." This suffix would be used by those in the Amateur Radio Service who handle traffic related to emergency and disaster situations. According to Pitts, this recommendation, made by Willem Visch, PG9W, would let anyone listening immediately know there was emergency traffic and lessen the chances of someone unintentionally breaking in on an emergency net.

Another recommendation included the extension of "EmComm Party on-the-Air." These are Emergency Communications exercises already in place in Region 1. Seppo Sisatto, OH1VR, Region 1 representative, proposed holding two annual international drills, lasting only 4

hours, beginning November 11. This, he said, recognizes that major calamities can and do cross international borders, and hams need to practice for such times.

GAREC suggested that the IARU initiate studies in cooperation with its Member Societies and with specialized emergency communication groups. These studies would focus on the development and possible introduction of standard codes for use in international emergency communications, as well as on the need for the development of a list of standard resource types.

The conference announced its support of the IARU's Administrative Council decision to collect information from all Member Societies about the status of implementation and application of the revisions to Article 25 of the ITU Radio Regulations (RR) resulting from WRC-03. The part of Article 25 concerning Emergency Communications says "Amateur stations may be used for transmitting international communications on behalf of third parties only in case of emergencies or disaster relief. An administration may determine the applicability of this provision to amateur stations under its jurisdiction" (RR 25.3), and "Administrations are encouraged to take the necessary steps to allow amateur stations to prepare for and meet communication needs in support of disaster relief" (RR 25.9A).

GAREC appealed to all of the IARU Member Societies, as well as specialized emergency communications groups, encouraging the accession to and ratification of the Tampere Convention on the Provision of Telecommunication Resources for Disaster Mitigation and Response Operations by their respective national authorities. The US has not yet ratified this document, but word was received during GAREC that Ireland announced their accession to Tampere. There are currently 37 countries that have adopted Tampere.

The conference also appealed to the IARU to "further encourage the development and the application of new modes and technologies in emergency communications," and to support the development of training aids. This includes the handbook on emergency communications, initiated by the 2005 and 2006 GAREC conferences, "and the development of a handout to inform the public, in particular during major conferences such as the forthcoming WRC-07, as already decided by the IARU Administrative
Council in 2005." GAREC also asked the IARU to "continue its support to the continuation and further development of the GAREC concept and process."

GAREC also asked Amateur Radio contest organizers to include a provision in their rules that contest participants avoid frequencies in the immediate vicinity of the Center of Activity frequencies (as proposed at GAREC-05); these frequencies are 14.300, 18.160 and 21.360 MHz. According to Pitts, "This would minimize interference to weak or distant stations which may be passing emergency traffic, but not heard in the contest din." Region 2, of which the US is a part, has not adopted the Center of Activity frequencies, but they will be discussed at the next Region 2 meeting in Brazil next month.

Conclusions
Zimmermann said, "With the conference in Region 2, GAREC has established itself in a major event in the field of Emergency Communications. What started in Region 1 as an independent event, has in 2006 found wider attention due to its combination with the International Conference on Emergency Communications (ICEC-06) and now with the ARRL National Convention in 2007. It is, however, only thanks to the hosts of these conferences, that they can fulfill the purpose set out from the beginning.
"Only the actual implementation and application of the recommendations made by GAREC can be the ultimate criteria for the success of these conferences, as a tool for the further development of the role of the Amateur Radio Service in the provision of emergency

communications. The appreciation expressed by numerous participants following each one of the so far 3 events, and the increasing interest demonstrated by the number of participants must be taken as an obligation to work even harder on the subject, rather than being considered a cause for satisfaction with what has been achieved. The statement of GAREC-07 shows, that much remains to be done. In addition to new proposals, it reiterates some still pending issues raised in 2005 and 2006."

Sumner said GAREC stressed interoperability. "In explaining how they are applying specific advanced technologies to emergency communications, speaker after speaker identified interoperability with other technologies and networks as a key objective. It was a joy to share the GAREC experience with nearly 100 dedicated, committed Amateur Radio volunteers who were as intent on cooperating as on explaining and advocating their favorite technologies. This spirit of cooperation and the recognition of the need to preserve our interoperability bode well for the future of Amateur Radio emergency communications, and for our ability to continue to serve our local, national and global communities."

Sarratt agreed. "This was truly a successful conference. The knowledge gained on technology, networking, organizations and hardware exceeded our expectations. This knowledge and the relationships developed will pay many dividends during disaster relief efforts."

Tying it all together was a call that came in right as GAREC was closing. Beepers went off, text messages were received, radios echoed throughout the hall as the National Weather Service and SKYWARN issued an alert to North Alabama due to high winds and oncoming storms. Pitts said, "The alert and call for ham radio help underscored the dedication and need for those volunteers better than any final speech could have done. It was like, 'The party's over -- we go back to work!'"

4485. Deluo DB9 Pinout...

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-25 16:43:38 UTC
From: Eric Goforth
Topic: 4485 Message: 4485

Hi all;

I picked up a Deluo WAAS GPS from Byonics and the DB9 / Power cables too. I can't find the pinout for the DB9 once it is attached. I found slews of pinouts on the "PS/2" cable that the GPS has, but can't find anywhere what the pinout becomes once the DB9 is put in place..

Anyone have any ideas? Thanks.

Eric Goforth, N6GOF (-1)

Eric, the pinout for the DB9 female of the Deluo
tracker adapter is:

Pin 2: TX Data (To the tracker/computer)
Pin 3: RX Data (from computer)
Pin 4: +5VDC Power In (LIMIT IS +5VDC, NOTHING MORE)
Pin 5: Ground

I carry both the Deluo GPS and tracker adapter, for
future reference.

I have a stand alone digi and it was a little tricky at first. What I would do it checkout www.nwaprs.info and compare notes (TNC settings). They have current digi settings and I believe this to be a very accurate source to compare with.

Second, I would check Bob Bruninga's site, www.aprs.org and also compare TNC settings. You may find something in your settings incongruent with the proper settings.

Let me know what you come up with. If you still cannot find the problem, please let me know and I can send you my TNC file for the KPC3+ and you can change my settings to what you need.

4490. [ADVERT] TinyTrak's & GPS's

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-27 14:08:30 UTC
From: Jim
Topic: 4408 Message: 4490

If anyone in the UK is looking for a built TinyTrak, I have some listed on eBay.

http://tinyurl.com/2rfrjs

They are RF hardened, being in aluminium cases with all lines filtered.

There are also some GPS's listed, which if you buy both I'll throw in the lead to connect the two and run the GPS from 12v.

Jim, G1HUL

4491. [APRS] [ADVERT] Pico packet TNC

Yahoo group: APRS (2007 — 2010)
Date: 2007-08-28 07:55:15 UTC
From: Dave Aitch
Topic: 4491 Message: 4491

And if anyone in the U.K is looking for a PacComm
PicoPacket (Standard 128K) unused, boxed,
drop me a line please.

Cheers,

Dave.
Portland. Dorset.

4492. ARRL / TAPR DCC (Digital Communications Conference) 2007 Conference Schedule (Tentative)

Topic: 4409 Message: 4493

Hi all,

Rod wrote:

>How do I keep all the information remembered in the program?

You register it with the author(s) and pay the registration fee.
Most versions of APRS are shareware ... fully functional, but will not
save your configuration data until registered.

>I am using WinAPRS.

Quoting WinAPRS' documentation:

MacAPRS and WinAPRS are shareware. The shareware registrations are
* WinAPRS or MacAPRS $50.00
* both to the same call sign for $75.00
The downloadable versions of MacAPRS and WinAPRS are fully functional and are
the SAME versions that registered users have. The only difference is that if
you are not registered, you cannot save your settings. One registration covers
ALL aspects, there are no hidden charges or extra charges for extra features.
When you register, you will receive a validation number. This number allows
you to save your settings.

All payments MUST be in US dollars and checks must be drawn on a US bank.
International money orders are also fine.
Please send shareware fees to
Mark Sproul 698 Magnolia Rd North Brunswick, NJ 08902

4494. WinAPRS, another Question

Yahoo group: APRS (2007 — 2010)
Date: 2007-09-03 00:45:15 UTC
From: Bill P.
Topic: 4409 Message: 4494

I am a long time registered user of the windows version of WinAPRS and keep it updated.

My question is about the File Save Configuration, does anyone know exactly what parameters are saved? I was hoping that it would save the screen zoom level, map and the live connection to the internet servers so when restarting, it begins with the parameters where it last left off. Right now the only thing that is saved for sure are the SETUP parameters. I use both RF and TCP/IP connections depending on what I want to see on the display. Text Messaging was highly desirable a few years back, the WinAPRS human interface and RETRY counter could be better.

For those who haven't tried WinAPRS, its industrial strength, it does everything, maybe not the very best of everything but you have to know how to use it. Update the TIGER maps to the very latest versions from the internet to improve the reliability.

Thanks Sproul Brothers ... Bill K6ACJ HF AND VHF WINAPRS, HF-PSK63-WINAPRS

Introduction to Eagle CAD by Dan Welch, W6DFW
Introduction to HF Digital by Steve Ford, WB8IMY

-- -- -- -- -- -- -- -- --

Sunday Seminar

A Stroll Through Software Radio, Information Theory, and Some Applications
By Bob McGwier, N4HY

The Sunday seminar this year will cover several technical topics. Software Radio will be the main theme and a package of tutorials and give away software will be a part of the seminar. The attendee will be exposed to the basic concepts of and building blocks of a simple software radio system and some information theory exposure will be given. The quadrature sampling detector will be analyzed and why it is such a wonder will be discussed. Its wonderful properties make it an excellent choice for a linear transponder system so its use in the AMSAT software defined transponder will be

discussed. Some necessary information theory will be discussed with
examples with the goal of leaving the attendee with a working knowledge of
the practical use of this theory in thinking about communication systems.
Finally, as time permits, we will show some software radio systems from the
$30 softrock40 to GnuRadio/USRP doing multi megabit per second OFDM on the
air and then a technical description of the Flex5000 and DttSP will be
given.

4500. Steve Fossett

Yahoo group: APRS (2007 — 2010)
Date: 2007-09-06 03:34:05 UTC
From: Paul Lee
Topic: 4500 Message: 4500

Fossett is still missing. Hope they find him OK.

Fossett had a typical ELT that apparently did not turn on or was out
of range. An APRS tracker would have been far superior in locating him
if he had one. Works very well for me so far and gives peace of mind
to relatives - and useful to FAA on a flight plan.

4502. Aprspoint 4.2.6 is available

Yahoo group: APRS (2007 — 2010)
Date: 2007-09-08 01:52:38 UTC
From: hxc98
Topic: 4502 Message: 4502

New version of aprspoint is released,
1. Added GPS panel to display real time GPS data, lat, lon, altitude,
speed, course, distance to destination and time to destination etc.,
2. Fixed an altitude computation error, fixed tnc data window scrolling
problem and several other bug fixes,
3. Added sound alert for tracked station report,
4. Improved GPS back end processing,

Details are on www.aprspoint.com .Thanks.

The orginal question had to do with whether or not, Steve Fossett was wearing a watch - not if an ELT was on board the aircraft.

As for the ELT, the local news reports were that it was on the aircraft - but, questions remain as to whether it was operational.
In any case, it does not seem to have been triggered, as the signal was never picked up.

4510. Why local digi not seeing me???

Yahoo group: APRS (2007 — 2010)
Date: 2007-09-13 16:31:57 UTC
From: sailingto
Topic: 4510 Message: 4510

Hello all. I just found this group and joined. I'm pretty new to APRS - just installed a D700A on my goldwing motorcycle a couple weeks ago. My problem:

I'm riding from Fairhope, AL over to work each day and have not been getting into the digipeaters that well. The KI4ELU-7 I get to nicely when in range, but as I cross I-10 to the north, I do not get digi'd very good. When on I-10 I am VERY close to W4IAX-7 digi. See below for my raw packets showing KI4ELU-7 as the first digi that picks me up. Note that N4ESS-2 in the next batch of raw packets is picked up by W4IAX-7 digi even though he's futher away than I am. Can anyone give me any ideas as to "why" W4IAX-7 digi does not pick me up? I'm using a D700A radio mounted on a motorcycle.

Any help with understanding would be greatly appreciated. A good track can be found at http://aprs.he.fi/?addr=36532 and change the time from 1 hour to a time for 6am this morning to see my track to work.

I was told I have a *very* slight amount of engine noise on my transmitted signal, so I tested with engine and switch turned off and don't really seem to get into digipeaters any better.

Thanks for any insight and info.

CNN reported:

Fossett's plane was equipped with an emergency beacon, and he was
wearing a high-tech watch capable of generating a similar alarm.
Searchers have received no signal from either device, and haven't
spotted a lower-tech distress signal such as a fire or massive X made
of rocks or sticks.

4512. ARRL/TAPR CONFERENCE LISTS SPEAKER SCHEDULE

Yahoo group: APRS (2007 — 2010)
Date: 2007-09-15 05:32:05 UTC
From: Mark Thompson
Topic: 4512 Message: 4512

==> ARRL/TAPR CONFERENCE LISTS SPEAKER SCHEDULE

The ARRL/TAPR Digital Communications Conference, scheduled for September 28-30 in Hartford, Connecticut, has released its slate of speakers. The three-day conference is an international forum for radio amateurs to meet, publish their work and present new ideas and techniques. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results and practical applications.

Registration for the DCC is still open and will be available at the door.

Friday's speakers include Bob Bruniga, WB4APR, speaking about "The APRS Local Voice Repeater Initiative"; Ev Tupin, W2EV, speaking about "Growing APRS' Value within the Emergency First Responder Community"; Paul D. Wiedemeier, PhD, KE5LKY, will talk about "Performance Modeling of TCP and UDP over Packet Radio Networks Using the ns-2 Network Simulator"; ARRL Chief Technology Officer Paul Rinaldo, W4RI, will speak about "Results of HF Digital Protocol Survey"; Mel Whitten, K0PFX, will speak about "DRMDV for HF"; Bob McGwire, N4HY, is talking about "NUE-PSK31: A Digital Modem for PSK31 Field Operation Without Using a PC," and Bill Tracy, KD5TFD, will give an HPSDR update.

Saturday's line-up starts off with Steven Bible, N7HPR, and Robert McGwier, N4HY, giving an update on SuitSat-2; McGwier will also speak on AMSAT's Phase IV and "On a Method for Automatic Image Balancing in IQ Mixer Based Software Defined Receivers," as well as sharing presenting duties with Gerald Youngblood, K5SDR, with "The Flex 5000 and SDR Software." Roderick D. Mitchell, KL1Y, will speak about "The Integration of Amateur Radio and 802.11"; Martin Ewing, AA6E, will present "SurgeForge, Hamlib and Rigserve: Free Beer, Free Speech and Rig Control"; Frank Brickle, PhD, AB2KT, will talk on "The FSM Virtual Radio Kernel: Why, What and How (in that order)"; John A. Hansen, W2FS, will speak about "The Nordic nRF2401 Single Chip Data Transceiver," and Hank Javin and Jerry Newman will present "Transmission Lines, Parameters and Application in Communications Systems."

Two introductory forums are also scheduled on Saturday: Intro to Eagle CAD, given by Dan Welch, W6DFW, and Intro to HF Digital, given by Steve Ford, WB8IMY. The TAPR annual meeting is scheduled for Saturday afternoon.

Sunday's Seminar, a four-hour presentation led by McGwier on the topic of "A Stroll through Software Radio, Information Theory and Some Applications" will cover the basic building blocks of a simple software

radio system, as well as a discussion of information theory and its practical use in communication systems. As time permits, McGwier plans to demonstrate several software radio systems ranging from the Softrock40 to the GnuRadio/USRP and the Flex5000. Attendees will receive packages containing tutorials and software.

For more information on the ARRL/TAPR Digital Communications Conference, please see the conference Web site <http://www.tapr.org/dcc>.

4514. APRS antenna placement

Yahoo group: APRS (2007 — 2010)
Date: 2007-09-16 19:45:35 UTC
From: Paul Lee
Topic: 4514 Message: 4514

I have my tracker mounted on one lower side (inside) of my composite homebuilt aircraft with a 6" rubber duck sticking down/out through a small composite fin reducing the drag. It does OK but it seems that it transmits better on that side direction.

I am thinking of moving the fin/ducky to the center bottom of the plane to avoid the one side problem. With the ducky sticking out from bottom, would an aluminum foil above the ducky help to reflect the radio waves down and improve transmission? Or would it setup standing waves with dead spots?

KC0WIF

4515. Consolidated Archives at APRSDEPOT.COM

Yahoo group: APRS (2007 — 2010)
Date: 2007-09-16 22:12:51 UTC
From: Eric Goforth
Topic: 4515 Message: 4515

Hi All;

This is a quick announcement that APRSDEPOT.com is now archiving messaging among all of the major APRS related email reflectors. These are read only and you still have to be a member of the various lists to participate with them, but at least now there is a consolidated location that users can search among ALL of the major lists for assistance and to search out answers to questions or research APRS in general. The archives are listed at the bottom of the forums. If anyone sees a list that I didn't include, or if you have one that you want included, just contact me and we'll get it setup.

Hope this proves to be of use to everyone...

Cheers,
Eric J. Goforth, N6GOF

Hi Paul,

When we put antennas on the composite panels or cowls on helicopters we usually bond some .020 aluminum to the inside an ground it to the antenna and the airframe. If it's not properly grounded you can some real funky results with your instruments. I try to make the plate at least quarter wave. Make sure you bond it with Metalset aka JB weld for the no aviation world.

If you make the foil into a circle about nineteen inches in diameter and
attach it to the antenna connector's shield, it will act as a ground plane so
you should get a better pattern along the horizon ... assuming level flight!73

"Down" isn't usually the problem direction, since you are seldom very high above stations below you; perhaps a slant range of 3 to 10 miles or so... but the distant horizon is where the need for signal punch is the greatest. Frankly, unless the APRS infrastructure is really sparse where you are flying, or shielded by terrain, as in my area of the Appalachians, APRS from a plane is a slam-dunk. I have good results with quarter wave whips inside the rear canopy of my RV-6A at power levels of 0.3 to about 6 watts.

Look for my flight track from yesterday afternoon on one of the tracking sites (tactical callsign "n30yd")to see the worst-case performance I've ever had at 300mW from a microtracker and quarter wave whip inside the plane. Packets got into the system from above 4000'MSL (which is about 1000-3000' HAAT around here,) but on most flights I do much better accessing the digi network, with tracking proving very reliable above 3000' MSL. I figure if I add the 8 watt Byonics amp, I'm good to go under virtually all circumstances. The problem is determining when I need the extra power to be tracked reliably - won't know till I'm back on the ground!) I'm using a WIDE 2-2 path and smart beaconing at about 120 sec at cruise.

My impression is that your antenna setup will prove non-critical at power levels above about a watt.

Good luck,

-Bill N4DLN

He did have an ELT on board. But ELT failure rate is about 25% - and in the mountains there, obstructions could make it out of range. ELT's are not always the best for that purpose - never mind the regs. A APRS tracker would have been far more useful in his case. There are digis in that area.

A while back I launched a minimalist APRS beacon on three 12" party balloons - it put out about 20 mW and had no GPS, and most of the weight was in the 3 AAA batteries. With a lithium battery you could build one with half the weight, and a better transmitter design (and thinner PCB) could give you at least twice as much output power with no weight increase.

Pack the balloon into a carrying cylinder with a small hydrogen gas generator and GPS receiver to program the beacon at launch, and you could get a signal out of any RF hole.

As long as it's not too windy, anyway. But hey, how often do planes crash in bad weather? =]

Even if you crash in an RF hole, having an APRS breadcrumb trail leading to the crash site is an incalculable advantage. I'm not planning any flights without APRS now, even just around the patch. Why not give yourself every advantage? (Says the man without a 406 MHz EPIRB yet :-)

How would the CAP and FAA know to check APRS. I'll bet the CAP has enough amateur radio types to really make it work well if thy knew you had it in use but I am not so sure about the FAA. (I don't have a 406 MHz EPIRB either.)

Through police interviews with family most likely. Of course if the
police didn't know what APRS was or how it might be useful to the
search they might not even bring it to the attention of the search
teams.

For $20/yr you could start your own simple website - like NYourTailNo.com - where you link your tracker to findu.com. I do that and include that URL in my flight plan remarks for tracking. The FAA briefers so far have generally been enthusiastic about it.

Domain providers - for example domainprocessor.com - give you a free domain forwarding. You could link your tail number (say N123AB) URL N123AB.com directly to http://www.findu.com/cgi-bin/find.cgi?N123AB You just tell the flight plan briefer to put "N123AB.com for tracking" in flight plan remarks.

If you are better with html you could build a small webpage for N123AB.com with the findu.com link and other emergency contact info helpful for S&R.

Good idea, Paul. What APRS tracker power level have you found suitable for flight tracking in most conditions? I think my typical flights of just s couple thousand above average terrain in the mountains and far from major cities is a bit of an extreme case, versus cross country at 8-12 thousand and over some larger population centers.

Topic: 4500 Message: 4529

At the moment I am using a Kenwood TH-D7A packaged together into a compact unit with a Deluo GPS (see http://www.abri.com/sq2000/GPStrack.html) Thats about 5W power with only a ducky. I transmit every minute. The results have been very good with only occasional small gaps. So far the worst was a 45 minutes gap somewhere over Montana mountains.

I am now building a compact Bionics Micro-Trak 300 unit and will see how that performs. It has SmartBeaconing, so you can reduce the beacon rate when taxiing or standing. They also have an 8 watt unit.

Consider getting a _good_ replacement antenna for it: You'll get
out much better. The Kenwood ducky is know to be pretty poor,
unfortunately I can't remember which antennas people recommend to
replace it. Check the APRSSIG archives at tapr.org as I know it's
been discussed many times before on there.

I use a TT3, a Delorme serial output GPS (w/GST-1) and a IC-V8 (5W) with a lick-em stick-em antenna on the rear window. The whole thing is powered by a gel-cel batt. On a flt from CMH to ORM, at 2000 to 6000 AGL I didn't see any holes, including asending, desending and taxing.
I did not file a flight plan but my son in OH, who was keeping track knew where I was. Would have been better if an offical agency had known also. I know "file a flight plan."

Not everybody would agree that it is better that Big Brother is
keeping track of where everybody including oneself is, be it on the
ground, at sea, or in the air.

If you make the foil into a circle about nineteen inches in diameter and
attach it to the antenna connector's shield, it will act as a ground plane so
you should get a better pattern along the horizon ... assuming level flight!73

4534. Running APRS with no serial port?

Yahoo group: APRS (2007 — 2010)
Date: 2007-09-19 19:59:15 UTC
From: Peter Dakota Summerhawk
Topic: 4514 Message: 4534

Afternoon,

Ok just picked up a new laptop and low and behold no serial port! Is there someone out there that is using a USB to serial converter to interface with the TNC? I have a KPC3+ if that helps and was curious as to if the same runs true for the GPS as well as the one I had was serial but have been thinking about using a USB to serial converter to run it directly into the laptop.

Suggestions?

Thanks

Dakota Summerhawk

A "garden variety" USB to serial converter has always
worked in that application for me.

Ditch the paranoia, guys. The US government has refused to make satellite recon photos available for SAR purposes. The photos contribued to the Fossett program are FROM A PRIVATE COMPANY.

This is plain capitalism, there are several private vendors who will do the same thing, for almost all of the earth.

||>known also. I know "file a flight plan."

So that was a wish that an official agency should know the whereabouts
of all of us at any time.
I would think I am entitled to walk (or fly, or sail) around without
official agencies keeping track of me, if I wish. It's one of my
personal freedoms.
I _can_ switch off my APRS gear and my cell phone.

Who suggested that you cannot turn it off? The idea is for those of us flying planes to have greater safety factor in event of problems. We don't have to. We choose so.

What is the problem?

Are you a pilot? Do you have a plane?

Here, you can look at my plane position:
http://www.findu.com/cgi-bin/find.cgi?N416 I don't mind.

Dakota-
Any "USB to serial port " gizmo may work, but the ones that are most likely to work have the Windows HCL logo certification for a particular operating system on them. That limits your choices to Keyspan, IBM, and some with the FDCI(?) chip in them from other small vendors. A logo-certified adapter has been run through a gamut of tests and found to work reliably for most users in most instances. One without the certification, has had less time and money invested in testing it.

The difference is often less than $5.

There have been long discussions on several other lists
about USB to serial converters and incompatibilities
between software products and operating systems and
serial ports and more, and the Keyspan units have solved
several of those issues.

Belkin has been a distant #2.

Bluntly, if you can get a Keyspan at a decent price, get it.

I guess Keyspan at $34 Guess I will have to get two and use them for the new laptop. One for the TNC and one for the GPS.

On another note has anyone used aprspoint? Been looking at it and thought it might be better than the current Winaprs version I am using now.

Thoughts?

Thanks

some users are having problems using the belkin usb to serial converter. I use the keyspan versions and have great luck.

I talk to kamPlus, kpc3, kpc9612, and scs tcns all with great luck.

I also use the keyspan to program my tt3+ and to talk to gps's for mapping.

Dakota-
If you need two adapters, also consider this:
If your PC has a PCMCIA or other card slot, you can sometimes get an i/o card for it that has genuine serial/parallel ports on the card, with dongles. The advantage there is that these are not "emulations" and there are no layers of software drivers involved. These are 100% genuine hardware-level COM ports. Not cheap, not always easy to find. (Lenovo makes a bay adapter as well, that has one parallel and one serial port replacing a "bay" device).

But, 100% genuine hardware ports.

Supposedly Belkin's new drivers solve many of their problems. Personally...much as I like their cables I'd rather buy gizmos from people who have already done the testing. That's not my job, life's too short to be the unpaid product tester for cheap hardware.

Find out how you can get spam free email.

APRS -- Moving Hams on Radio and the Internet
-- A Guide to the Automatic Position Reporting System
by Stan Horzepa, WA1LOU

APRS is among the most popular activities using personal computers in ham radio applications. Getting started often requires little more than a VHF radio and computer. With a portable Global Positioning System (GPS) receiver, you have precise position information at your fingertips. Connect the GPS receiver to your APRS station, and you can transmit your location information even as you're moving!
Track moving objects on maps (other stations, public service vehicles, marathon runners, etc.).
Display weather statistics and storm warnings.
Find a hidden transmitter or jammer.
Access the APRS network on the Internet (even without a radio!)
The future for APRS applications seems limitless! In this book, you'll learn how to configure hardware and software to make the best use of your APRS station. Software examples include programs for Windows, Mac and Linux. Follow detailed discussions of APRS operation and technical support. To help you get stated, there's also a complete Glossary of Terms and a summary of APRS software commands.
APRS -- Moving Hams on Radio and the Internet is the third APRS book written by QST columnist and ARRL author Stan Horzepa, WA1LOU. Softcover. © 2004, The American Radio Relay League, Inc. APRS is a registered trademark of APRS Engineering LLC, which reserves all rights to its use for commercial products.

(ISBN: 0-87259-916-7) #9167 -- $17.95

||Who suggested that you cannot turn it off? The idea is for those of us
||flying planes to have greater safety factor in event of problems. We
||don't have to. We choose so.

Reply: Nobody suggested I couldn't turn it off. Somebody in the list suggested the authorities should track somebody, said in a follow-up to the case of a disappeared person (in the US?) who had been in a plane and also was said to have worn a tracking device on himself. I would say that he is/was entitled to disappear.

||What is the problem?

||Are you a pilot? Do you have a plane?

No. But I am a boat owner, and I am sailing around every now and then. And if I _want_ that somebody should follow my position all the time, I'd send it all the time, and tell that somebody how to follow my position. But I do _not_ want that Big Brother should be able to track me at any time.

||Here, you can look at my plane position:
||http://www.findu.com/cgi-bin/find.cgi?N416 I don't mind.

OK with that.
You might find me as well by my callsign with or without a -9.

yes, OT for sure but the very first sentence of that report contains
errorneous information which makes the remaining arguments invalid. there
was nothing 'secret' about the so-called warrantless wiretaps. the leaders
of both parties in congress were briefed on this prior to the start. the
opposition party only publicly expressed their 'outrage' when the times
leaked the story. one can only assume that they felt no moral outrage
during the briefing.

I am trying to see about getting the 4 port usb adapter and mounting it underneath the laptop mount I have but they run $140 on the site that has the ones for $34 each, might just have to spring for the money anyways and leave both the GPS and the TNC in the car hooked to the radio and just take the laptop when I need to.

Suggestions?

Dakota Summerhawk

Dakota-
If you need two adapters, also consider this:
If your PC has a PCMCIA or other card slot, you can sometimes get an i/o card
for it that has genuine serial/parallel ports on the card, with dongles.
The advantage there is that these are not "emulations" and there are no layers
of software drivers involved. These are 100% genuine hardware-level COM ports.
Not cheap, not always easy to find. (Lenovo makes a bay adapter as well, that
has one parallel and one serial port replacing a "bay" device).

But, 100% genuine hardware ports.

Supposedly Belkin's new drivers solve many of their problems.
Personally...much
as I like their cables I'd rather buy gizmos from people who have
already done
the testing. That's not my job, life's too short to be the unpaid
product tester
for cheap hardware.

I have similar setup and use 2 generic usb to serial connection on a USB hub. They converters were some cheapos I picked up online for <$5 I use them at work for programming equipment and other terminal programs. They use the Prolific 2303 chipset. I noticed some that use other chipsets have caused lots of problems. The Prolific chipset is also what is used by the Deluo GPS for their USB interface cable.

I have 2 of them connected to a hub under the seat with a long USB cable. Before I got the TNC I used a USB sound card for the interface and had that on the hub also. When I want to use it I only have 2 cables to plug in, USB and Power.

The only problem I ever had was with the Laptop and not the adapters. The Laptop I was using would, if idle and on battery, power down the USB ports to conserve energy apparently. As long as the power adapter was connected everything worked fine.

4555. Looking for Parts for THD7A

Yahoo group: APRS (2007 — 2010)
Date: 2007-09-25 03:42:17 UTC
From: Mr. Kurt F. Rubin
Topic: 4555 Message: 4555

Hi Group,

Looking for parts for my Kenwood Ht. Looking for power
cable/gps cable for a E-trac. Someone in a group gave
me a link and I lost it. Now that I have it fix right
I'd like to find the rest of the parts. And is there a
Link for cell phones to look at aprs locations. Thank
for all your help.

4557. Ping/Message to Mobile via IGate

Yahoo group: APRS (2007 — 2010)
Date: 2007-09-25 23:30:23 UTC
From: jkrayfield
Topic: 4557 Message: 4557

I think I'm a bit confused, so can someone please explain something to me?

I have UI-View32 running on a computer at my office/shop. It's connected to the internet and is connected to one of the APRS servers (I think in Florida). It's set up as a Local Server, too. It's also connected to a radio on 144.390 mhz. I have this 'system' set up as an IGate, both RF into Internet and Internet to RF.

I have UI-View32 running on a computer at my home. It's connected to the internet, and is connected to the IGate at my office via this internet connection.

Should I be able to 'ping' another station, through the IGate? Or should I be able to send a Message, or a Query, through the IGate, to any other station that shows up in the APRS network? Or are pings, messages, and queries only sent via RF (RF to RF, locally, such that I can only ping another station if I have a radio connected to my UI-View32 station here at home and the 'receiving' station is local, within RF range of my home station)?

I will be interested in the responses to this also - I read somewhere that UiView required the "I" to be placed in the port when sending msg... I don't have the info handy here at work, but I have the same problem. I have UI-View32 running at home via internet (no Radio), and I can send a msg from my mobile to my computer via a local Igate, but I can not send from computer to mobile.

Directed queries (to a specific callsign) should work through
igates. General queries should not, as the amount of responses
would be immense in that case.

> Or
> should I be able to send a Message, or a Query, through the IGate, to
> any other station that shows up in the APRS network?

Yes. I do messaging inet->inet all the time with Xastir, and it's
very fast. It doesn't even matter in the case of internet->internet
QSO's if the stations are authenticated amateur radio stations or
not in that case. Once you want to "escape" from the internet back
out onto RF though, you need to be authenticated else your packets
won't get gated to RF by the igates.

I also do messaging internet to RF across the country our outside
the country, and rf->internet->rf messaging pretty much anywhere in
the world. The stations just have to be within reach of an igate at
each end and it's all automatic otherwise.

I understand you are using Xastir for all this? The O.P. asked about
Ui-View32 which I am also using.

I'm using Xastir on my end of the connection, yea. The other end is sometimes UI-View, sometimes Xastir. It could be nearly any client program on either end and still work. You don't even need to be authenticated onto the APRS-IS in order for the TCP->TCP messaging to work.

Yea, but we'd like to send a msg or ping from my computer running Ui-View32 to my motorcyle mobile. This requires my Ui-View to send the msg to the internet, then for an Igate to pick it up, then send to out via RF to a digi so I can pick it up.

I send the msg via the local digi - should I be using the closest Igate as the routing?

Perhaps. Some igates are one-direction. You need to get your
packet to the closest igate that does two-way igating in order for
messaging to work, and the outgoing path on RF from the igate has to
be sufficient to reach to your RF station.

If there's not an igate close enough to you for proper functioning
of messaging then running your own igate may be a reasonable option.

Here in the greater Seattle area if I can make it to any one of the
wideN-n digipeaters I'm within range of an igate, so the NA
recommended paths work fine for messaging. If you find you need to
deviate from the recommended paths for your area, consider other
options first.

Never put the I-gate in the path! I-gates are different than
digipeaters. The path is for digipeaters only. The I-gate simply
gates everything that it hears to the APRS-IS.

and you might want to ask the owner of the Igate for the area in
question if she or he will let packets from you be sent from that
Igate to RF.

Hello all, I sent this info on to some of my local surounding digi owners, and decided that I'd share with the yahoo groups as well. There is some interesting information, and a link to a sound file of a 1:40:00 long conversation with Bob on the local repeater. As you can tell from the conversation, Bob is pretty passionate, and would love to see his Local Info initiative spread through the county. I've implemented it in our area, as you can see by the photo's of my radios, here's hoping that more of you will agree with his vision.

4568. TNC settings for KPC3+ and APRSPoint?

Yahoo group: APRS (2007 — 2010)
Date: 2007-10-02 06:25:41 UTC
From: Dakota Summerhawk
Topic: 4566 Message: 4568

Morning,
I know there is someone out there that can tell me how to set up the KPC3+ to work with APRSPoint. Running KPC into a serial converter and the GPS into another serial converter both into a 2.0 USB hub into the laptop. APRSPoint is seeing the data on the GPS but nothing on the TNC. Comm ports have been adjusted so that they are different in the device manager so no conflicts there.

Suggestions?

Thanks
Dakota Summerhawk

4570. APRS settings in small town

Yahoo group: APRS (2007 — 2010)
Date: 2007-10-03 00:52:45 UTC
From: Rod Bartlett
Topic: 4570 Message: 4570

This is the 3rd month in a row that I have asked this question. Can anyone please help me with these settings.

I am trying to cleanup our APRS network.

I have 3 Digis in a triangle about 10 miles on a side.

The Igate is using an old Icom 2AT to communicate to Digi-1.

Digi-2 & Digi-3 can only get to the Igate via Digi-1.

I need recommended UNproto settings for each.

Igate (UI-View - MFJ 1278)

Digi-1 (D700)

Digi-2 (MFJ 1278)

Digi-3 (KPC3)

Thanks

Rod - N8QVR

Rod,
We have our club meeting next week and I will bring it to the aprs group and see what they say, meeting is next Tuesday or you may want to try the RM-APRS group as they have a lot of Elmer's out o the list that might be able to help as well.

Let me know and I will see what I can do for an answer for you ok?

Dakota Summerhawk-N0WRE

Project: XASTIR (xastir)
Package: xastir-development
Date : 2007-10-05 12:00

Project "XASTIR" ('xastir') has released the new version of package
'xastir-development'. You can download it from SourceForge.net by
following this link:
<https://sourceforge.net/project/showfiles.php?group_id=45562&release_id=516341>
or browse Release Notes and ChangeLog by visiting this link:
<https://sourceforge.net/project/shownotes.php?release_id=516341>

A Linux Standard Base (LSB) binary package plus SuSE Linux 10.0
RPM's corresponding to this release are available at the usual
sites.

The Xastir homepage is listed below.

4574. How can I force an APRS text message based on a contact closure

Yahoo group: APRS (2007 — 2010)
Date: 2007-10-07 06:32:21 UTC
From: kc7raf
Topic: 4574 Message: 4574

I need to send a predetermined APRS text message based on a contact closure. In quickly reviewing the APRS Protocol information I found the scripting for a message. I thought I would be real smart and use that message protocol embedded in the periodic text that can be sent as part of a position packet. However, not being as smart as I thought I was, that didn't work. Further reading of the protocol tells me that the initial character of the entire data stream must be a ":". Since a position data string, such as is generated by a TinyTrak, is always preceded by a "!" and thus a ":" embedded in the start of the periodic text accompanying a position string is not seen by the system as a message.

Are there any established trackers, such as the Open Tracker, that have developed such an animal. I envision a tracker that could be set up as a standard tracker but a contact closure would send a predetermined message instead of track information with a settable repeat period of 2 to 3 hours and would return to the standard tracking mode when the contact opens. Specifically I would see the format as ":EMAIL :emailaddress message text". The total text length, including the email address would need to be at least 50 characters.

Any thoughts, ideas and suggestions would be greatly appreciated.

I've thought about doing something like this with the OpenTracker or Tracker2, and in fact if you look at the Tracker2 code you'll see a block that was added (and is currently commented out) that'd send a message with the highest altitude reached, so the T2 in my balloon payload would record its maximum altitude even if it didn't get a beacon out right away.

The OpenTracker+ will transmit a raw string when you start a line with !, so you could use it with a Basic Stamp or something to send your messages.

Or, you could modify the OpenTracker+ code yourself (if you're ok with C programming) to do what you want.

The Tracker2 supports messaging with automatic retries and ACKs, so you could hand off the message processing to it by using the 'SEND' command. I've used this with a serial barcode reader to make it send canned messages printed on a sheet of paper.

I wanted to add a scripting feature that'd let you do exactly this sort of thing with the Tracker2, but at this point I don't know if I'm going to be able to find code space for it. If I do, it might be by ripping out some of the features like Garmin protocol support and making a dedicated telemetry and control version of the firmware.

I've also considered creating a server that'd listen for more efficient event notification packets, so you could keep all of the email addresses and message text on the server instead of the tracker, but I haven't had a chance to do it yet.

Hi Scott,
Thank you for responding so quickly. You have discovered one of my short comings. I have only taken a cursory look at what it takes to program the OpenTracker. I pulled down a copy of the raw code for the otwincfg.exe configuration file. Interesting that the first time I opened I got what it appears to be just machine code in text form, obviously it is the compiled code from the C program. The next time I pulled it down it shows up as an application. Your site recommends a programmer / compiler and I took a quick look at the site but have not explored what it will take in $ and programs to accomplish a programming change. I will take another look at that and see if I can figure it out. I have a couple of months before I will need the capability so that will make a good winter time project - I need to become much more familiar with C anyway. I haven't really programmed anything since the old Basic days. If I can get the decompiled code I can probably figure out what's going on - given time and some hope that the code has a few comments in it. Any guidance you can give a neophyte in this area would be helpful. If you don't have the time, I understand that also - just send me on my way to do my homework before asking more dumb question.
Thanks again and 73,
Hall, KC7RAF

The source code (not including otwincfg.exe) can be found at
<http://www.argentdata.com/community>.

To compile the OT1+ code, you'll need the free version of Freescale's
CodeWarrior. I've heard there may be issues getting it to compile under
the latest version (6.0), but I know it works fine under 5.1. I'll
check out the newer version when I get a chance. I think the problems
are due to differences in the project file format.

The Tracker2 code is too big to compile with the free version.
Unfortunately there's no good free compiler out there for the HC08, so
you're stuck spending about $3k on a CodeWarrior license if you want to
go that route.

For the OT1+, you can get most of the way there with no code changes
just by setting the transmit interval to 0 (disabled) and putting some
message in the comment text. The IRQ pin will trigger a transmission
when it's pulled low. Assuming you've got it set to allow transmission
with no GPS fix, it'll send the comment text in a status beacon. That's
almost what you want, except it'll start with a '>' which keeps you from
sending a message that way.

You can either come up with something to watch the APRS IS stream for
that message (aprsworld.net might even do that now), or you could make a
slight change to the OT1+ code to eliminate the '>'. In the current
version, that's going to be at line 462 of tracker2_main.c (yeah, the
filename is confusing, it's not for the Tracker2) - just comment it out,
or use that line for your email address:

```
send_data(">", 1);
```

becomes (for example)

```
send_data(":EMAIL :scott@... ", 26);
```

It'll append the comment text to that, as well as the digital counter,
supply voltage, and temperature if you've got those enabled.

What it won't do is retry the message if it doesn't get an ack. For
that, your best bet is to start with the Tracker2, and either add on a
Basic Stamp (set to send the message command in response to an input) or
wait until I get back from China and have a chance to add an email
notification feature.

Hope that helps...

Scott,
Noting that you have set up the OpenTracker for the text to be sent as either Comment or Status I have more thoughts - you can tell me if this would be viable. Given that the APRS Date Type Identifier for STATUS is a ">" I would establish a 3rd option of the Text selection field to be Message which would use the ":" as the needed Data Type Identifier. This would then let the user set the "callsign : message text" in the text field. I would then use that in the 2nd profile and switch the profile when the monitored contact closes.

I'm sure that I am glossing over some "minor issues" like programming space on the chip and my ability to learn to make such a change. One possible way around the programming space on the chip would be to 'just' change the program area where Status is configured and change it to the Message configuration. Either case I would have to be able to change not only the effective output of the program but the GUI for the input screen.

Another question - would it be better to move this entire discussion to the OpenTracker group?
Thanks for your time and patience.

Adding anything to the configuration complicates things due to shortage
of space in the configuration data structure, added complexity in the
configuration program, and added documentation.

For your own use, you wouldn't have to change the config program at all.
You could just change the behavior of the firmware without adding any
new configuration fields.

And yeah, if we're going to talk any more about the details of the
OpenTracker, it should probably be moved to that list.

Anybody use FoxTrak unit from http://www.foxdelta.com/ ?
Comments? It appears to be similar to TinyTrak3+

Or is this the wrong place to ask?

4581. Re: APRS settings in small town

Dakota, I appreciate any help you can give. My main issues are how to set the UN statements to get away from Relay, etc.

My Igate can only communicate with Digi1.
Digi2 and Digi3 need to communicate back to Digi1 to get to the Igate.

Thanks

Kurt,

If you are referring to a frequency control program then yes, from Kenwood:

Hi Again

It is the Rookie again. Now I have the gps/cable. And
I set it up How the Book said but It does not work. I
set the Gps part to dmde (spelled wrong) part and
nothing. The Gps is plugged in and looks hooked up and
powered. What step is missing. And I can transmit with
no gps fine. where Have I gone wrong??

I'll even call you if u give me your # to help.
pls help

4584. ARRL/TAPR Hold Digital Communications Conference - 2008 DCC in Chicago

Yahoo group: APRS (2007 — 2010)
Date: 2007-10-06 05:32:52 UTC
From: Mark Thompson
Topic: 4584 Message: 4584

==> ARRL/TAPR CELEBRATE 26TH ANNUAL DIGITAL COMMUNICATIONS CONFERENCE

The ARRL and TAPR held their 26th Annual Digital Communications Conference this past weekend, September 28-30, in Hartford, Connecticut. The DCC is an international forum for radio amateurs to meet, publish their work and present new ideas and techniques. Presenters and attendees had the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results and practical applications.

With more than 150 in attendance during the three-day event, ARRL Chief Operating Officer Harold Kramer, WJ1B, said, "It was exciting to see and hear about the latest developments in Amateur Radio digital technology. The depth of knowledge, commitment and enthusiasm were very impressive and bode well for the future of Amateur Radio."

According to QST Editor Steve Ford, WB8IMY, many of Friday's seminars were devoted to the Automatic Position Reporting System (APRS). Bob Bruninga, WB4APR, gave the first session of the conference, "The APRS Local Voice Repeater Initiative." Bruninga is the developer of APRS.

Other seminars at the conference included "The Flex 5000 and Software Defined Radio Software," "HPSDR Update," "AMSAT's Phase IV," "A Method for Automatic Image Balancing in IQ Mixer Based Software Defined Receivers" and "Suit-Sat 2 Update." Ford also gave a standing-room-only seminar on an introduction to HF digital.

Ford said one of the highlights at the DCC was the NUE-PSK device. This gizmo makes it possible to do PSK31 without a PC. There is no word yet on when kits will be available for this item. "The latest Flexradio software-defined transceiver also drew a great deal of attention," Ford said. RPC Electronics debuted their all-in-one APRS tracker (2 meter transmitter, packet TNC and GPS receiver in one compact package). The company said it would be available for sale in December, just in time for holiday giving.

A popular feature of the DCC was the Demonstration Room. This was a place for participants to set up their projects for everyone to see, as well as a place for vendors to demonstrate their equipment.

ARRL New England Division Director Tom Frenaye, K1KI, spoke to conference participants Saturday morning, welcoming them to the DCC. TAPR held their annual meeting later that day.

The 2008 Digital Communications Conference will be in Chicago, but no
date has been set. Check out the TAPR Web site <http://www.tapr.org> for
more information.

Paul,
Are you talking about the APRS tracker? Looks to be about the same as the tiny trak from bionics. I bought one (tiny trak) and love it. I got the package with the GPS and Kenwood cable to hook to my TK-760 for aprs and my weather station but haven't had the time to get the weather station installed but plan to and see how it works out. Byonics was very helpful in getting my questions answered and getting me in the right direction.

Thanks for the link though, looks like a good project!

Dakota Summerhawk

4587. TinyTrak 4 - Due out around Nov 1st

Yahoo group: APRS (2007 — 2010)
Date: 2007-10-09 22:11:58 UTC
From: Rod Bartlett
Topic: 4587 Message: 4587

The TinyTrak4 should be released in the next few weeks. You won't find it listed on there webpage, but here is the link. Estimated cost of $60.

http://www.byonics.com/tinytrak4/

Highlights from webpage.

Byonics is pleased to announce...

TinyTrak4

TinyTrak4 takes the features of the TinyTrak3 and adds...

DSP Packet Decoding - Using software DSP, the TinyTrak4 can not only decode 1200 baud packet, but also 9600 baud, and 300 baud packet, DTMF, and more. Since the decoding is not hardware based, new demodulation capabilities can be added to existing TinyTrak4s.

Field Upgradeability - New firmware can be downloaded for free from the TinyTrak4 website and sent to the TinyTrak4 with a computer serial port.

Analog Telemetry - TinyTrak4 can read temperature, battery voltage, and other sources.

More powerful processor - TinyTrak4 has more processor speed, code space, RAM, and EEPROM than the TinyTrak3 to allow for more features.

Implemented and Planned Functionality:

Field upgradeability
TinyTrak3 features - Most all the TinyTrak3 functions have been translated to the TinyTrak4
KISS TNC
Diagnostics to test all the TinyTrak4 hardware
APRS tracker that can plot positions as waypoints on compatible GPS receivers
9600 baud and 300 baud encode and decode TNC & Tracker
DTMF encode and decode - use for remote control, logging, transmitter hunting
Weather station support
PSK31 support
Smart Digipeater
Telemetry
Remote control
Full TNC

Rod,
Can this be used for a tnc to decode aprs as well as send? If that's the case sign me up for one! Been looking at several TNC option for running APRS in the car and didn't want to spend $180 for a KPC3 as I already have one for the house.

Let us know on that can you?

Thanks
Dakota Summerhawk

I use the Tinytrak3 in my vehicle. I heard about the tinytrak4 a year ago and have been waiting for it to come out. I sent them an email a couple of weeks ago and they told me it would out around Nov 1st.

This is a full blown TNC. It is also a smart Digi. Full APRS capability and will even track local traffic and waypoints on a compatible GPS. Plus much more. It is still the same size as the Tinytrak3.

Have you looked at the Tracker2? I just started shipping those. Won't have large quantities until at least the end of the month, though, so I haven't done much marketing. I don't know what features are finished in the TT4, but last I checked it was still catching up. The T2 sells for $85 assembled, metal enclosure included.

The OpenTracker+ will also do some of the things the TT4 will - waypoint output included, and it has a KISS mode. Kits start at $32.

http://www.argentdata.com/catalog

I'd include more details but I'm writing from the airport in Taipei and it's not a great connection.

The Tracker2 is amazing little box for the price. The difference between the Tracker2 and the TT4 are the functions that are currently implemented. At the last time I checked, the TinyTrak4 only had minimal TT3 tracking function, KISS support and waypoint out put. The major downfall is the tracking feature and KISS feature are seperate firmware loads. The Tracker2 has both of these available at any time. Just a couple of simple terminal commands to switch. The point I am making is the Tracker2 is a real living working unit, not a webpage with a mile long unimplemented feature list.

The OpenTracker+ is a DECODING capable version of the OpenTracker 1x. You can even reflash the OT1+ with KISS firmware and turn it into a cheap KISS TNC modem for use with many APRS software flavors and hardware. Over on the HamHUD side, we are using KISS flashed OT1+'s with our latest HamHUD KISS firmware and it works like a champ! Scott even has an SMT version of the OT1+ that is in the form of a 24 pin DIP IC. This too can be flashed with KISS and made into a micro KISS modem or used as a tracker. We have several HamHUD users that have embedded an SMT OT1+ inside of their HamHUD for a more compact unit.

$32 for a working KISS modem WITH case is a real deal. Turn around, reflash it with the tracker firmware and make it a tracker. Hard to argue with that.

Topic: 4587 Message: 4592

I would like to add my 2 cents worth...

I just bought my 3rd OpenTracker2, I currently own about 4 TT3pluses and am very happy with my all TT3's, as well as Byons Support.

But the OT2's are a dream come true, like Jason said the OT2's have every feature I can use in each unit, without re-flashing firmware. I have also noticed that they "HEAR" much better then AGWPEPRO, running them with "open" squelch is decoding about 30% more stations on my iGate (over AGWPEPRO).

My only wish would be for "Davis" weather station support (smile)

4593. FW: TinyTrak 4 - Due out around Nov 1st

Yahoo group: APRS (2007 — 2010)
Date: 2007-10-10 13:51:02 UTC
From: Tim Smith
Topic: 4593 Message: 4593

The Optentracker 1P from Argent has been shipping for a while that supports a KISS configuration. It supports HAMHUD or a PC with software (UI-VIEW or similar).for only $32 in kit form. Although it does not have DSP capabilities (that I know of), it's a great low cost solution for a KISS TNC to use with HamHud or your PC while mobile.

See http://www.rpc-electronics.com/trackers.php

Scott,
Can the Opentracker2 be used with APRSPoint? That is the program I am using. And what kind of GPS can be used? I have a serial GPS if that helps. Using a laptop for the APRSPoint that I am using a serial to USB converter on as there is no Serial port on the laptop.

Let me know can you?
Thanks

From: N3UJJ (Scott Gillis)
Topic: 4587 Message: 4598

Dakota,

I personally have no experience with APRSPoint, but I do use AGWTracker & UI-VIEW (mobile & base), and both of these programs work well with the OpenTracker2m (in my testing so far).

I'm hoping to go "LIVE" with OT2m tonight on my iGate (making it a digi). The iGate has been running 3 days already with the OT2m (in place of AGWPEPRO), and it has been working much better then I expected.

As long as there are not too many "HoneyDo's" when I get home the digi should be up by 9pm (est)

Scott,
Can the Opentracker2 be used with APRSPoint? That is the program I am using. And what kind of GPS can be used? I have a serial GPS if that helps. Using a laptop for the APRSPoint that I am using a serial to USB converter on as there is no Serial port on the laptop.

Let me know can you?
Thanks

I trust the OpenTracker 1+ so much that I based my all new RTrak on the SMT version.

See it here: http://www.rpc-electronics.com
RTrak Yahoo Group: http://groups.yahoo.com/group/rtrak

I noticed that someone put a link to my buying page (RPC Electronics). I am an official reseller for Scott (Argent Data). He and I both frequent this list, so either of us can sell you the kit. Scott just happens to be the manufacturer. I also offer the OpenTracker 1+ pre-built for a little more.

The Tracker2 isn't sold as a kit - it was during beta testing, but the
current version is mostly surface mount and wouldn't be practical for
hobbyist assembly anyway.

Sorry for the slow response... the hotel took two days to get my
Internet access working, and my broadband card doesn't work in Hong Kong.

From: Scott Miller
Topic: 4593 Message: 4603

The OT1+ doesn't have a true digital signal processor, but it does do digital signal processing. The AFSK demodulation is all done in software. I've also written some code to do DTMF decoding, but I'm not sure that'll work on the OT1+'s processor (it's meant for a faster chip) and it certainly won't be doing both at the same time.

Ok so another question to the list, what TNC will support a GPS that DOES NOT need an external power source? I am asking as I have enough power cords to tie myself up many times over. I am looking for a TNC and GPS that all I have to do is supply the TNC with power and it will power the GPS as well.

Thanks

Dakota Summerhawk

Dakota,

For the most part all the latest generation of tracker will power a GPS

TT3(plus)
TT4
OT1+
OT2m

All the above will power a gps with the proper cable

Topic: 4587 Message: 4606

The OpenTracker+ and Tracker2 will both provide 5 volts for a GPS
receiver, and so will the TinyTrak3+.

4607. [APRS] TinyTrak 4 - Due out around Nov 1st

Yahoo group: APRS (2007 — 2010)
Date: 2007-10-12 13:57:26 UTC
From: Dakota Summerhawk
Topic: 4587 Message: 4607

The reason I ask is that I want to use the laptop with APRSPoint and not really a tracker, Sorry if I wasn't clear on that point. The laptop is going to be used for runs, races and special events so I need something that will function as a full TNC and not just a tracker but will also power the gps as well.
Sorry for the confusion on that.

Thanks
Dakota Summerhawk

Dakota,

The your only (low cost) options are:

OT1+ (Need to load tnc firmware)
OT2m (best choice in my opinion)
TT4 (still in beta)

All of the above have outstanding support, and are quality products

Scott Gillis N3UJJ

Scott and anyone else,

How would these compare to the TNC-X for use with Paclink AGW
and UI-View? I don't really need a tracker but it might be a
nice bonus feature.

From: ki4rhu
Topic: 4611 Message: 4611

HI all,

I am new to this and can't find the information from Kantronics web site.

What I am trying to do is using either of these TNC and connect it to an Icom IC-2100H by using a cat 5 cable sliced into the serial cable provided by the TNC.
When I now plug everything together the TNC will come on but then go dead for a few minutes, it will come back on after I unplug the connector from the radio.

Can anybody help me out.

Thanks,
Doug

Doug,

Your radio should be connected to the radio port on the TNC, not the serial cable. The serial
cable should just go to your computer.

4614. Byonics MT8000 inquiry

Yahoo group: APRS (2007 — 2010)
Date: 2007-10-19 03:25:19 UTC
From: Wayne
Topic: 4614 Message: 4614

Hi all.

This is my first post to this group. I am looking to find out if the MT8000 by byonics is worth considering? I simply would like to find a relatively inexpensive way to get into APRS and report position, for stormchasing, etc.

I think the MT8000 and a byonics GPS antenna would be really easy. But, since its only a transmitter, how much trouble would I cause if it collided with other signals? Is that a big problem in your view?

Cheap is the watchword I'm afraid to say... I also have lots of radios in my truck already, so I don't want to go to a lot of hassle for putting in a handheld or high power radio for APRS work.

Any experiences with small/compact/easy systems would be appreciated.

Regards,

Wayne, ke0ms

4615. MT300 instead of MT8000?

From: Wayne
Topic: 4615 Message: 4615

I'm sorry; this is a correlary to my previous post about the MT8000.
Any idea if 8 watts is really necessary? Is lower power a problem?

Thanks for your guidance.

Wayne, ke0ms

4616. Right Angle 2.5mm Plug and Cable Assembly

Yahoo group: APRS (2007 — 2010)

From: Tony Annese
Topic: 4616 Message: 4616

Does anyone have a source for a 10 foot cable assembly for the GPS port on a D700/D710?

It has a 2.5mm stereo plug on the end.

Kenwood changed the jack location from the radio to the remote head. Now my old D700 cable looks stupid sticking out 2 inches from the side of the head.

Thanks..

Tony, KG4EXA

Tony,

You can get a 10 foot cable with 2.5mm right angle stereo plug one end and stripped tinned leads
on the other end from Mouser, PN 172-2110 5.68 plus S&H. <http://www.mouser.com/>

I've got 6-foot cables for $2.50, plus cheaper S&H than Mouser:

https://www.argentdata.com/catalog/product_info.php?products_id=29

Looks like I need to order another batch, though... almost out again.
Plenty of speaker mic cables, though - I just got about 40 pounds of
them in yesterday!

If you need complete GPS cables for the D7/D700/D710, check out
www.rpc-electronics.com.

Contact Kurt Meltzer at Meltzer Radio Engineering (
<mailto:mre1032@...> mre1032@...). He has an eBay store at
<http://stores.ebay.com/MRE-Direct> http://stores.ebay.com/MRE-Direct, with
a 100% positive feedback rating over more than 1,700 items.

Kurt has provided our radio club with a couple dozen cables of various
types, many of them one-of-a-kind. They were all fully functional and of
superior quality, at a more than fair price. He just made up a GPS cable
for my new 710A.

I have no affiliation with this gentleman, other than that of a delighted
customer.

Hope this helps.

From: projecthiker
Topic: 4620 Message: 4620

Ok if you are going to flame me, do it but I have go to ask. I have searched and havent found the information I was trying to aquire. Is there a difference between programs for the d700 and d-star. Or is there a way to do the same thing using d700/7a that dstar does. I.E. internet, mail, and the likes I see advertised.

4621. Ham radio balloon with APRS 100,000 feet over Texas this morning

Yahoo group: APRS (2007 — 2010)
Date: 2007-10-20 13:18:32 UTC
From: Craig
Topic: 4621 Message: 4621

The ARBONET folks will be launching a balloon this morning
with a Cross band FM repeater (445.800MHz Up 147.560 MHz Down)

http://www.arbonet.net/gpage6.html

Here is some info on Clarksville/Red River County Airport

http://www.airnav.com/airport/KLBR

since they are broadcasting APRS packets on 144.39 MHz you should be
able to track the location and altitude of the balloon from this
website

http://www.findu.com/cgi-bin/find.cgi?call=K5FRC-11

For a map of all the APRS activity in the area use this link:

http://mm.aprs.net/map.cgi?map=APRSworld&lat=33.59383&lon=-
95.06567&call=*&range=1

for a list of nearby aprs stations click here:

http://www.findu.com/cgi-bin/near.cgi?call=KC5ILO-3

Hopefully the balloon launch team will be able to let us know when
the balloon launches and other information by sending APRS messages to
the balloon callsign (K5FRC-11) over 144.39 MHz

If that happens you can see the messages here:

http://www.findu.com/cgi-bin/msg.cgi?call=K5FRC-11

New in this version,

1. Improved log file replay, with the ability to apply track list and filters during the file loading process to reproduce different tracking scenarios, and the ability to adjust replay speed,
2. Added TCP raw data window, and option to turn it on/off for better performance,
3. Improved subnet filter handling,
4. Streamlined filter, settings, and track options interface, plus other enhancements,

Visit www.aprspoint.com for more details and download.

I have seen a couple of different lists but personally I have never seen a need to assign SSID numbers. I recommend that if you have only one packet radio station then just use your call sign with no number behind it.

I believe that in the distant past some groups tried to assign SSID numbers before the symbols were added so in my opinion there is now even less reason to hang numbers behind your call unless of course you have more than one.

Why add more complexity when its not needed?

Also, here is a great website for looking up APRS stations on a map.

http://www.findu.com/cgi-bin/find.cgi?call=K5FRC-11

just change the callsign at the end of the link to look up any APRS station. Because of those silly numbers you will have to try 15 different times to make sure you find that station.

Here is another great website for displaying APRS stations

http://aprs.he.fi/?call=K5FRC-11

Craig,

If you do not know the station(s) SSID use an asterisk
"*" at the end of the call as a wild card and findu
will list the choices for that call sign.

http://www.findu.com/cgi-bin/find.cgi?call=K5FRC*

3 separate ssids:

http://www.findu.com/cgi-bin/find.cgi?call=KK5RZ*

SSID's, when used properly, are useful for identifying mobiles and such. For instance, a "-14" tells me, at a glance, that the station is a commercial vehicle. Nice if you're using a TM-D700 or '7.

A station without SSID would be a home station, which I don't bother checking. Houses are very boring to watch on the map!

Findu allows you to wildcard stations, so if you typed in "KE1LB*", and you'll see any of my stations used lately. This eliminates having to try all 15 silly numbers.

Thanks Jim and Eric for the tip about the wild card "*". I didn't know that trick.

Eric, I have to ask, why is it important to know what kind of vehicle that APRS beacon is in?? So far I have only cared about knowing which APRS station has a person there and sometimes I care about knowing where the high digipeters are located. We have a digipeater down here where I live and sometimes people try to send APRS messages to it. Its an automated machine that only repeats. no one will ever read that message.

The only time that really comes into play is if you're running
straight NMEA sentences across the air instead of one of the APRS
formats. In that case there's no way to specify the type of symbol
to appear as on people's maps other than the SSID.

I run an SSID of 12 in my Jeep, which puts a little Jeep symbol on
the map. I don't need to run -12 'cuz I'm running Base91 Compressed
APRS packets, which have the symbol specifiers in the packet as
well.

If I was running something like an old TNC that could only run NMEA
strings (like a KPC-3 or 3+ perhaps), then the -12 would be the only
way that I could specify my symbol.

Correct on the -0. There are four bits available, which give you -0
through -15 as possibilities over RF. Most people run -0 for their
home stations, or for their mobile if they don't have a home
station.

If you're on TCP, you can go higher than 15 because you're not using
AX.25 protocol there. Some APRS software will handle those higher
numbers, some won't.

Bob Bruninga (WB4APR) has suggested a scheme whereby the APRS software can know whether a station has a live operator. Probably APRSdos has implemented this already, but I don't know of any other client software which has. The idea is that one of the E/W or N/S letters in the packet changes it's case based on whether the keyboard or mouse has been used recently, and the symbols change somehow on the map screen at the receive end to show the "manned" stations.

> and sometimes I care about
> knowing where the high digipeters are located.

I believe most digipeaters should be a "star" symbol unless they also have a weather station there. Also there should be an overlay character on the symbol which shows which type of digipeater they are. I don't remember the specifics on the overlays.

As a truck driver, I like knowing when another truck comes up. As soon as I see "-14", then I can investigate and go to the list in the D700. Ditto for "-9", I know it is a personal vehicle. It's a preference thing.

As for the digi, if it has a proper ssid (1-4), and new users are aware the proper use, then it would eliminate the messages.

http://web.usna.navy.mil/~bruninga/aprs/SSIDs

Yeah, Bob says here that many are obsolete, but I don't always agree with the father of APRS. Some are pushing us Mainers pretty hard to use The New Paradigm, forcing those who run remote, very remote in some cases, sites, to go through all the garbage of updating firmware and equipment. HUGE pita for those who have multiple digis, being provided for FREE. The New Paradigm is NOT NEEDED here in Maine. What blows out the bandwidth for San Fransisco isn't an issue here.

I guess what I'm saying is be careful what you "obsoletitize", as many may still have a call for it.

Cheers!

Eric,

There is one problem with you thinking. If everyone switches to the new paradigm, as we have in Connecticut, and Maine doesn't, then those going thru Maine on the new paradigm won't get digi'd and when those from Maine go thru states that are on the new paradigm you won't get digi'd. It seems like it needs to be everyone change or nobody changes. Seeing a lot are already changing Maine should follow suit.

Fran, W1FJM

I got a question on that, my home station is N0WRE I am thinking of adding trackers for both my wife's car plus my own so what SSID do I use for the trackers? Both are cars so there is no potion to have it as truck or the like.

Suggestions?

-9 seems to be the standard for cars. People are also using -4 although that was supposed to be for home stations. The only ssid not on Bob Bruninga's list is -5, don't see why that can't be used for mobiles. But, I'm just guessing.

I personally would like to see you assign your three APRS beacons to the first three SSID's (N0WRE-1, N0WRE-2, N0WRE-3) and then wherever you are, change that beacon ID to just N0WRE so the rest of us will know that your other two stations are unattended.

But all three stations are unattended at times. The house (N0WRE) runs without intervention on my part. The trackers do as well as they are just HT with TT3 attached. So would it be better to have N0WRE-1 for the house and then -2 and -3 for the cars?

hi all
you can see the standard for EU here

SSID -0 (no SSID) should be used for all fixed stations (home-qth)
SSID -1 should be used for all sorts of gateways (IGATE, Sat-Gate,
HF-Gate and so on)
SSID -2 should be used for APRS-WIDE-Digipeater (which are all
digipeaters with aliases of (RELAY, WIDE and TRACE)
SSID -3 should be used for APRS-RELAY-digipeaters (aliases of RELAY
only)
SSID -4 unassigned
SSID -5 should be used for WX stations
SSID -6 unassigned
SSID -7 should be used for special mobile stations (truck, bicycle,Taxi,
motorbike, Jeep, bus, RCV ect., NOT for normal cars)
SSID -8 should be used for fixed, portable stations
SSID -9 should be used for normal cars
SSID -10 should be used for Sat-stations (using APRS via satellite)
SSID -11 should be used for TCPIP stations
SSID -12 unassigned
SSID -13 unassigned
SSID -14 unassigned
SSID -15 unassigned

This is only a proposal for all hams, which should help to clear up APRS a
little bit. We request to use it, but it's not mandatory.

The big thing is tell that to the gents who supply the workhorses of digipeaters. Good digi sites here are most likely to be in a remote, or hard to get to, location. That, couple with cost of upgrading software and/or equipment, is burdensome to those gracious enough to give us the great coverage.

The big thing is tell that to the gents who supply the workhorses of digipeaters. Good digi sites here are most likely to be in a remote, or hard to get to, location. That, couple with cost of upgrading software and/or equipment, is burdensome to those gracious enough to give us the great coverage.

"we" are "the europeans", then? or the IARU Region 1? In both cases,
it has been quite unknown to me, even if I have been using APRS for
quite some years. Or, I suspect, "we" are just some who have been
talking together.

However, the symbol used in the station setup is more important than
the SSID.

Carl,
After reading the post it makes sense. But I have to ask if you have two cars that you track you can't have two unis with the same call and ssid can you? I would think that would drive the system nuts trying to figgure out which one ah which or at least drop one out? I don't know the ins and outs of the digi system. That's why I asked about what I'd to use for each car. The home station now has no I'd and is just my call but I have not changed the cars as of yet.

Subject: Re: [APRS] SSID ??

hi all
you can see the standard for EU here

SSID -0 (no SSID) should be used for all fixed stations (home-qth)
SSID -1 should be used for all sorts of gateways (IGATE, Sat-Gate,
HF-Gate and so on)
SSID -2 should be used for APRS-WIDE-Digipeater (which are all
digipeaters with aliases of (RELAY, WIDE and TRACE)
SSID -3 should be used for APRS-RELAY-digipeaters (aliases of RELAY
only)
SSID -4 unassigned
SSID -5 should be used for WX stations
SSID -6 unassigned
SSID -7 should be used for special mobile stations (truck, bicycle,Taxi,
motorbike, Jeep, bus, RCV ect., NOT for normal cars)
SSID -8 should be used for fixed, portable stations
SSID -9 should be used for normal cars
SSID -10 should be used for Sat-stations (using APRS via satellite)
SSID -11 should be used for TCPIP stations
SSID -12 unassigned
SSID -13 unassigned
SSID -14 unassigned
SSID -15 unassigned

This is only a proposal for all hams, which should help to clear up APRS a
little bit. We request to use it, but it's not mandatory.

From: Greg
Topic: 4622 Message: 4649

Hi All,

This discussion seems related to the symbol created by the SSID; why are we reinventing the wheel, when the document that explains it is already written?

The APRS Protocol Reference document (Protocol Version 1.0) lists the three methods to create symbols (display icons), and they are: AX.25 Information field, AX.25 Destination Address, and SSID in the AX.25 source address.

I here fellow hams say .... my car's SSID has to be -9, but these same hams setup a symbol using the Information Field /> , for the example of a car.

In fact, if you read page 16 "The AX.25 Source Address SSID to specify Symbols" section, you'll read this:

start quote

"If, however, the Source Address SSID is non-zero, APRS inteprets it as a display icon. This is intended for use only with stand-alone trackers where there is no other method of specifying a display symbol or a destination address (e.g. MIM trackers or NMEA trackers).

For more information, see Chapter 20: APRS Symbols." end quote

Bob's link explains why SSIDs were first used, and now that most trackers can insert the symbols from the primary and alternate symbol tables, it makes the use of SSIDs to indicate the 'station type' also obsolete.

http://web.usna.navy.mil/~bruninga/aprs/SSIDs.txt

73's

Greg VE9GFI (and -1, and -2, and -3).

A standard "oops" done by the newbies is this: Set the home and the vehicle to the same SSID. Both are active. As the car drives around other people's maps show a trackline from the house to the car location. The car drives a bit further and leaves another track line. The house transmits, so you get a track from the car to the house. If the car drives AROUND the house location in a circle, you get a real pretty flower pattern on the map. Enough said?

Unless you're running an NMEA-only tracker (typically a generic packet TNC that has a few APRS capabilities), you should be able to set your symbol to any of the symbols in the APRS spec, and you won't be relying on the SSID for it's default symbol.

As far as the tables of SSID's that I saw floating around on this thread, there were a few of us around here that were old TCP/IP'ers and kept with -3. Perhaps I'm the only one still doing that, but there used to be several. -10 was used a lot around here for hilltop digipeaters, -7 for Kenwood APRS radios (or other message capable mobile setups), and -0 mostly for home stations. These days it just doesn't matter. Default symbols based on SSID is a feature that seldom people need or use anymore. I only see a couple of trackers running around here that are NMEA-only, and this is a high-use area.

Another newbie misconception correction - the sender does NOT transmit
the image to the recipient. The SSID is simply a numeric index (ranging
from 0 to 15) into an array of images contained in the displaying software.
As long as everybody has the same set of 16 images it all works the same.
If person A has one set and person B has another there is no way that
changing the SSID will synchronize the image sets.

That said, the SSID itself is obsolete. The actual image set used in todays
programs (like UIview) is standardized, and offers many more symbols.

One reference is here:
<http://wa8lmf.net/miscinfo/APRS_Symbol_Chart.pdf>

Ok so I adjusted the trackers today. Here is what I have:
Home: N0WRE
My car: N0WRE-1
Wifes car:N0WRE-2
So I haven't seen a set rule for setting SSID for having two cars with the same call. Yet. All stations are tracking well and I have the tiny tracks in the cars set with smart becon so it updates when moving more often. The home station is not going to be a digi as we already have one in town and its high enough up to cover everything points north, east and south of here.

Yet.

Once you get some experience with APRS you'll see the potential
problem. Imagine having two cars roaming around at the same time in
different parts of the county with the same call. On people's maps
the car will appear to jump between the two positions and leave a
track line between them each time it jumps. It'll make a mess of
everybody's maps.

It won't even make a pretty flower picture like it might if you set
the same SSID for your house and car and then drive a slow circle
around your house. ;-)

FWIW: Most of the people that work on APRS web or Wiki pages, or
work on the APRS programs themselves, experienced that sort of thing
so long ago that they forget what it was like to be just starting
out.

Setting different SSID's for each station seems like something that
should be added to the <http://info.aprs.net> wiki, in the
"Introductions" pages somewhere. Ok, done. See:

Topics->Introductions->Setting Symbols and SSID's

See this (new) Wiki page:

<http://info.aprs.net/index.php?title=SymbolsAndSSIDs>

A link at the bottom directs you to the default symbol by SSID
listing that included "RV". Please read the first page though:
Default symbol by SSID is rarely used these days.

The rule is: Each station needs to have a unique ID. If you have
more than one APRS station running under your call. Each one needs to
have it's own SSID. Period.

There is no longer any rules about SSID assignments, there are only
suggestions. You can use any SSIDs that you want. Just make sure
each of your stations use a different one. Did I already say that? :)

Your current setup is fine.

Ahhhh, "Wife's car"??? Would that not run under your wife's
license? OR do you plan to run the APRS ONLY when you are driving
the car? Is it not required to have a licensed person in the car
anytime a APRS station is running?

To answer the last question: No, it is not required. It depends a
bit on how the station is setup up though.

Please see the thread titled "Re: Newbie Questions, is Ham license
required?" from the TinyTrak list that occurred on October 9th,
2007. Once could also peruse the APRSSIG mailing list and find
threads at least twice a year that cover this issue.

My read on it is that people who haven't studied the FCC rules
enough tend to think that you need a licensed amateur to actually
_be_ with the APRS tracker.

Here's one of my current favorites:

I looked for the "RED: Newibe questions...." thead and did not find
in this group - was it in another group? Can you post a link?

Are you saying Mr Cross is wrong in his statements? For some reason
I was thinking I had read an actual response from Mr Riley of the FCC
saying a licensed ham WAS required to be present at an APRS tracking
station UNLESS some means were available to switch the station off
from a remote location. I am NOT sure of that, but I sure did think
I'd read it somewhere over the past 12 months.

I will also do a search (repost?) on the APRSSIG group tonight.
Perhaps someone there can direct me to Mr Riley's writing about APRS
requirement.

Please understand, I am NOT saying you are wrong - I am wrong myself
from time to time. My mantra is "the only person who is never wrong,
never does anything".

The wife doesn't touch the unit as it's all contained in the trunk, according to FCC rules its allowed as long as the only thing that can be accessed is the power switch and that's wired to the ignition of the car so when she turns the car over it turns on the tracker. All else is automatic. So we fall within the FCC rules for this. The issue was brought up on the aprssig a while back and the ruling was that non hams could have trackers installed in the vehicle as long as the only thing that could be accessed was the power switch and that no other settings could be changed.

Hope that answers your question as my wife doesn't have or want a call sign, we use MURS for comms when apart for short distances and cell for the longer distances.

I looked for the "RED: Newibe questions...." thead and did not find in this group - was it in another group? Can you post a link?

Are you saying Mr Cross is wrong in his statements? For some reason I was thinking I had read an actual response from Mr Riley of the FCC saying a licensed ham WAS required to be present at an APRS tracking station UNLESS some means were available to switch the station off from a remote location. I am NOT sure of that, but I sure did think I'd read it somewhere over the past 12 months.

I will also do a search (repost?) on the APRSSIG group tonight. Perhaps someone there can direct me to Mr Riley's writing about APRS requirement.

Please understand, I am NOT saying you are wrong - I am wrong myself from time to time. My mantra is "the only person who is never wrong, never does anything".

Correctumundo. See this page:

<http://info.aprs.net/index.php?title=ControlOperator>

I really like the quote from Riley Hollingsworth (FCC guy). The
quote from an Official Observer (also happens to be the PocketAPRS
author) is a real find as well. That link should help dispell
future arguments on this issue.

Please understand I am NOT fussing - just wishing a clarification of the point.... Does the FCC require a remote control device to allow you to turn the unit off when you are not present at the car? Ahhh, I now read you ARE in control by being able to call her on cell phone and "turn it off".

I guess that does fit with Mr Cross's statement of "When a station is under automatic control, regardless of the transmission mode, Cross explained, the control operator need not be at the control point, but must employ station control devices and procedures while transmitting that ensure compliance with the FCC rules and does not cause harmful interference to ongoing communications of other stations"

The "must employ" can be cell phone or whatever and doesn't really matter if time required is 3 hours before turning off - when wife returns from shopping even???

You folks are a LOT more knowledgeable than I am about APRS requirements - I make no bones about that. I KNOW I've read somewhere - and I sure did think it was from Mr Riley himself, that a APRS station had to be under control, and the example of wife's car was used and that was NOT acceptable.... Sure wish I could find that.

Until I do, I stand corrected and carry on. I will NOT complain. {grinning}

I'm relieved.I can't imagine having to hang on to the balloon during a launch to maintain station control.but again, the balloon would never leave the ground (easy recovery). There is so much precedence established for unattended tracking (without FCC, Amateur Auxiliary or OO intervention), that after the last decade, I'd be comfortable putting a tracker just about anywhere as long as it's operation could not be modified. Is it the issue of wife tracking or unattended operation? :-) Tim, N1TI

Morning,
The reason I placed the tracker in the car is that my wife commutes more than 100mi. a day. Cell phone coverage is weak and best and the tracker is only five Watts provides enough coverage between Digipeters to enable me if something goes wrong to at least to be able to track the car. As I said before all of the tracker equipment is in the trunk so the only access she has to it is the ignition switch of car when she turns the car over to drive the tracker is activated. The FCC has deemed this appropriate for use of the hams to be a will to track equipment and assets.
They hope this clears up some of the confusion as to why the wife's car has my call sign.
Thank you for the input in this matter I appreciate it.

Hi All, I have posted the following on the TH-D7 Group, but thought I would see if anyone on this group can cast any light on my problem When I receive an incoming position report on the Hand Held the 40 memory list shows the same callsign in each position in the list. ie when the next one arrives the new callsign takes up the entire 40 positions in the list. There was a similar question listed under "redundant Callsigns" on the TH-D7 list but no mention of any reason for the problem, or any solution, and that was asked back in 2005.. Has anyone had a similar problem, and what caused it and/or corrected the problem..? The only thought I have had was that I may have used an incorrect verion or setting of the Memory Manager program to set the radio up.. But I'm really grasping at straws.. Otherwise the radio appears to functioning correctly.. This fault means that I can't monitor an individual station and watch the changing information, as I approach or move in relation to the station.. Any suggestions appreciatively received.. Thanks Kim VK2ASY

Hello Kim. I had the same problem and don't remember what I did to fix it, but it was something easy. Try deleting the list several times. Hold down the A/B key for about 4 seconds, until you see the message, "DELETE ALL?" Then hit "OK" (the right mouse button) twice. If that doesn't work try a complete reset. Also, be sure to never plug in or unplug the connectors to the GPS or PC while the radio is on. That has caused some interesting problems. Good luck.....'73 de Dick W5UFZ

4669. Looking for easiest way to do Receive only APRS sites

Yahoo group: APRS (2007 — 2010)
Date: 2007-10-31 22:06:49 UTC
From: ve7ltd
Topic: 4669 Message: 4669

I have access to a remote linux PC, a reomte internet connection, and a standard serial TNC hooked to a remote radio. This is at a high altitude repeater site.

I also have a second (local) site with internet and a Windows PC running AGWTracker. This is in a Emergency Management Office.

What I need to do is use an APRS server or something similar on the linux PC to send the serial data received from the TNC to the computer running AGWTracker.

This system is separate from the large worldwide APRS servers, and does not need to transmit anything (receive only). It will run on 144.99 Mhz, and there will be no digipeaters. It will be for special events, and will consist of about 15 mobiles.

So my question to the group is, what combination of hardware and software should I look at to perform this at the remote site? I need to be able to get the data in an "APRS Server" like format, so that AGWTracker will recognize it and plot the points on the map.

My original plan was to use sound card decoding, but I can also use a TNC.

I also want to have the ability to add more receive sites to this network in the future.

Should I look at using APRSD or JavAPRS as a server? Or is there a simpler way to do this?

Also I have not bought the TNC yet. Any ideas what would be a good TNC to use for this? Since I am only converting the Packet tones to serial data, do I need anything more than just a simple TNC? Has anyone done this with just a sound card under linux?

Hi Dave! Small world.

You might try also asking the question in the linuxham group.

I did a key word search over there on "aprs" and "packet" and came up with a whole bunch of stuff I don't yet understand.

I'm very interested in using the spare capacity of your IRLP embedded controllers with the serial port to receive APRS messages from a TNC-X and forward them to the internet via an IGATE. If you find software that will do this job running on your controller please let me know.

also check out this thread:

http://groups.yahoo.com/group/APRS/message/3974

Here is the TNC-X website

http://www.tnc-x.com/

Craig

You can use AGWPE on Windows PC's, or "soundmodem" on Linux PC's to
do this. Soundmodem can be configured to look like a serial KISS
TNC to the applications software, or an AX.25 networking interface.

I'd recommend that you put a real TNC up though if you're talking
about a remote site.

> I also want to have the ability to add more receive sites to this
> network in the future.

Just curious, why receive only? Are you never intending to do
messaging or to post objects for the rovers or other home stations
to see?

I saw that you were talking about having one station at an EOC, so
if you're setting up an RX-only site, you're limiting your options
later for emergency support. Public service events help to train
people for emergency events. If you can do some messaging and
object creation/editing/moving/deletion to those events, you can
train people better for real emergencies.

> Should I look at using APRSD or JavAPRS as a server? Or is there a
> simpler way to do this?

Those would be some reasonable options. JavAPRSsvr is I think the
software running on most INET servers. Another possibility is
Xastir, but since you don't need a full GUI/mapping station at the
remote site you might not want to go that route.

> Also I have not bought the TNC yet. Any ideas what would be a good
> TNC to use for this? Since I am only converting the Packet tones to
> serial data, do I need anything more than just a simple TNC? Has
> anyone done this with just a sound card under linux?

Take a look at the Tracker2 TNC from Argentdata.com. It's quite a
bit cheaper than a KPC-3+. Has more features than a TNC-X but about
the same price. You can configure it remotely using standard APRS
messaging (that feature even works through multiple igates and
repeaters).

Yea, that's mine. Not solid enough for remote deployment, but some
people might have fun with it elsewhere.

I wrote that a long time ago and haven't played much with it
recently. Got kind'a busy with other APRS software projects and
lost interest in the Perl stuff. Xastir now does similar stuff.

Subject: Balloon Launch

10 MHz Amateur Radio balloon to cross the Atlantic

Amateurs at the University of Tennessee Amateur Radio Club are launching a balloon with a beacon in the 10 MHz Amateur Band that may travel across the Atlantic during its 5-day mission.

The latest Icarus X mission UX-19, will hopefully launch by next weekend and its goal is to be the first Amateur Radio equiped helium balloon to cross the Atlantic.

The balloon payload will include a GPS unit and CPU that will regulate the balloon's altitude and send telemetry on 10.123 MHz in CW and RTTY formats.

The 10 MHz transmitter will run 3 watts output into a half wave dipole hung below the balloon.

The students need receiving stations to copy the telemetry data. They have developed a decoding program that anyone can download from the University of Tennessee web site which will relay the values back to the campus server.

All that is needed for the receiving station is a good antenna and a computer with a high speed internet connection. Audio from the receiver is feed into the sound card of the computer and Mtty will decode the values and give a nice visual status page of the flight data. Also the data will be sent to the University of Tennessee's server where it will be placed onto the club's web page for everyone to follow.

The flight has been dubbed 'The Spirit Of Knoxville' after Lindbergh's first trans-Atlantic flight.

The flight could be up to a five days long but the actual crossing should take only three days. The balloon will be carrying enough ballast and battery power for five days and nights. Check the UT Radio Club's web page at http://www.utarc.org/ for more technical details and a host of photos.

This site chronicles the last years worth of effort at developing the hardware and flight testing the different systems to produce an autonomous altitude control.

In addition to the 30m beacon there will also be an APRS beacon
AA4UT-11 on 144.390 MHz FM.

University of Tennessee Amateur Radio Club
http://www.utarc.org/

If you go to their website and click on the Balloon Launch link right
above the article you'll go to a page with a neat You Tube video of a
previous launch.

73,
John - AG9D

Topic: 4615 Message: 4677

IMHO, Since this device does not listen for a clear channel before transmitting, the likelyhood of colliding is high enough without competing with very far away week stations. So I think the extra power (8 watts) is a good idea. I would not say that a 60 watt is a better idea than a 25 watt as the increased power ties up more of the coverage area than probably needed.

The answer also depends on your local network. Here in Southern California, there is good DIGI coverage in the flat lands but in the hills and mountains you would need all you can get just to cover the distance. IF your area has little APRS traffic and good coverage it might be a waste.

Also consider your antenna, it is much easier to get gain from an antenna change than even doubling your transmitter power.

I'm using the MT300 aloft in my experimental aircraft, over the mountains of rural Virginia, and find that results are, well, okay, but definitely inferior to what I saw with a 5 watt HT driven by an open tracker. Altitude helps, but the sparsity of the APRS ground infrastructure out here, combined with the mountainous terrain and the fact that the MT's transmit in the blind (without a TX delay for a clear channel) make for spotty results, even at 3 to 4 thousand feet above average terrain. I'm using a path of WIDE2-2. I plan to sell the 300 and upgrade to the MT8000 to overcome this problem.

Jamie was almost correct.

However, you can use a Kamplus or other TNCs that use the licensed pactor I protocal.

I have had great luck using Kamplus TNCs on winlink; albeit a lot slower than the SCS PTC. At one point I had 7 Kamplus TNCs in use. Now I have one Kamplus and one SCS.

So, the answer is that you can use the winlink network with pactor at pactor I speeds. To get a complete list of the TNCs that will work with Airmail download the program and look at the list.

Another TNC will sort of work but only for PACTOR I. SCS has not
licensed PACTOR II or III and a lot of Winlink stations have moved to
those to protocols. Thus you're still stuck with an SCS.

You can also do Pactor-I with two of the soundmodem programs in
Linux, no TNC required. Don't know if you can do the same in
Winders.

From: Mark Thompson
Topic: 4688 Message: 4688

APRS -- Moving Hams on Radio and the Internet
-- A Guide to the Automatic Position Reporting System
by Stan Horzepa, WA1LOU
APRS is among the most popular activities using personal computers in ham radio applications. Getting started often requires little more than a VHF radio and computer. With a portable Global Positioning System (GPS) receiver, you have precise position information at your fingertips. Connect the GPS receiver to your APRS station, and you can transmit your location information even as you're moving!
Track moving objects on maps (other stations, public service vehicles, marathon runners, etc.).
Display weather statistics and storm warnings.
Find a hidden transmitter or jammer.
Access the APRS network on the Internet (even without a radio!)
The future for APRS applications seems limitless!
In this book, you'll learn how to configure hardware and software to make the best use of your APRS station. Software examples include programs for Windows, Mac and Linux. Follow detailed discussions of APRS operation and technical support. To help you get stated, there's also a complete Glossary of Terms and a summary of APRS software commands.
APRS -- Moving Hams on Radio and the Internet is the third APRS book written by QST columnist and ARRL author Stan Horzepa, WA1LOU.
Softcover. © 2004, The American Radio Relay League, Inc. APRS is a registered trademark of APRS Engineering LLC, which reserves all rights to its use for commercial products.
(ISBN: 0-87259-916-7) #9167 -- $17.95

4690. Re: aprsfl.net down?

Yahoo group: APRS (2007 — 2010)
Date: 2007-11-22 00:32:46 UTC
From: Dave Anderson
Topic: 4686 Message: 4690

APRSfl.net is no longer offering full worldwide port 10152 feeds for the APRS-IS as of 11-19-2007.

E-mails were sent to QRZ e-mail records of those connected the week before this went into effect (those using the server's 10152 port), but some of the addresses were bounced as old, and not everyone has their e-mail on file at QRZ, so I was unable to contact everyone.

Full details on why I have taken this action are on my website:

http://www.aprsfl.net/aprs-is.html

Bottom line - if you don't need the entire world - take only what you need by using a user defined filter feed or use of of the pre-defined distance filter feeds.

At current counts of 23,000 stations a full feed requires close to 40,000BPS per connect, so keep that in mind as you choose a server to connect to. APRSFL had over 250 users pulling full feeds, if you do the math, you can see that's a TON of bandwidth being used.

Considering i've only ran into about 3 folks who needed the entire world for research purposes, this shouldn't be a huge impact for most of you. The web page link above also has all the port options available for you to choose from that will give you a smaller feed of just what you want, and also be more conservative on server resources.

Should you -absolutely- still need a full world feed, which most users do not, the core servers (I also run third and fourth) still offer them:

http://core.aprs.net

Dave, I suspect that most people are taking "the world" not because they want or need it, but simply because there have never been any really good, clear, concise instructions on how to restrict feeds. Clear, as in, including examples, definitions, and parameters.

I know last time I looked for them (a year or more ago) I found bits and pieces--but they were a headache to read, and folks I know who have tried to implement them, typically gave up on it.

I'm not throwing bricks here--just begging that if anyone really understands how to filter a feed, this is a subject that could use a good PLAIN ENGLISH WEB PAGE complete with illustrations of commands and their effects, defined in little words of unmistakeable clarity and meaning.

>including examples, definitions, and parameters.

Actually, in the case of APRSfl, it's because 10152 full world feed port is the default port on a default install of the UI-View software. :)

Now for the reasons of complicity you mention... There's no doubt that's part of the problem.

That's one of the reasons that the core server group and some servers like APRSFL.net created a set of ports that automatically just give you pre-set ranges of data sets.

No complicated filters, just pick a port number you want for a range of stations, either with or without non ham CW weather stations.

Those predefined filters use your lat/lon you put in your software to determine how far away you want to hear stations from.

Take a look at http://www.aprsfl.net/aprs-is.net - you'll see the list of port numbers to choose from.

http://core.aprs.net for the core servers also shows a very similar table of ports.

Some have said adding these extra ports added even more confusion than the manual filter on 14580, but I find most just want stations within a few hundreds of miles from their location, and these ports do just that, so just pick a number and add it to your server list in UI-View (press insert on the server list screen to add a new entry).

Let's not also forget, UI-View isn't the only program, and not all APRS software supports the filter string anyway... And as you mention, many who try 14580 get frustrated on getting it to work.

>I'm not throwing bricks here--just begging that if anyone
>really understands how to filter a feed, this is a
>subject that could use a good PLAIN ENGLISH WEB PAGE
>complete with illustrations of commands and their
>effects, defined in little words of unmistakeable clarity
>and meaning.

I'll not disagree here, but at 80 hours a week of work, I barely have enough time to run the servers, let alone write a document this comprehensive :)

Some things that can be done -now- though.

First... It needs to be understood that every server has a "status"
page....

http://<servername>:14501 - replace server name with whatever server you
want... As an example...

http://aprsfl.net:14501 -- this page shows all the current connections, port
assignments and what they do, and most importantly a full instruction set
for how to use the filter command, albeit it's just a list of commands the
filter uses.

M0CYP created a program that will take the data you want to pickup and
create a login filter string for you in a intuitive interface:

http://www.apritch.myby.co.uk/addon_misc.htm#filterwiz

Pete, AE5PL has the following page that simplifies creating a filter string
without the use of a program:

http://www.aprs-is.net/javAPRSSrvr/javaprsfilter.htm

And of course, e-mailing the sysop of any server you connect to should get
you personal help, the e-mail address of each sysop will be on that sysop's
server status page... I don't know of any server sysop not willing to help,
so that should be a option to always keep in mind.

Ultimately most picking a pre-defined port will do just what they need, in a
quick easy way.

There is a program, APRS Filter Wizard, that works with UI-View
and I believe as a stand alone program, that may help.
<http://www.apritch.myby.co.uk/addon_misc.htm>
I just installed it and and haven't had time to learn it yet,
but it appears to allow you to create a filter by selecting
items from a menu, copying the filter to the clipboard and
pasting it into your APRS application.

4698. SRB 2M Transmitter Now Available For Sale

Yahoo group: APRS (2007 — 2010)
Date: 2007-11-24 03:47:09 UTC
From: Jason
Topic: 4698 Message: 4698

Folks,

Tonight, we have posted the Small RF Budget 2 Meter Transmitter for sale. This transmitter is perfect for APRS trackers. The transmitter's power output is 850 mW @ 8VDC. You can use one of the pre-set 16 frequencies via four control lines, as well as program the unit via I2C or SPI control lines.

Price is $75 per unit, plus shipping.

Please visit the RPC Electronics site to order:

http://www.rpc-electronics.com/rf.php

There, you will also find the latest manual for download.

Thanks You!

TO: FAMILY & FRIENDS

The BIG trip is here, it is moving time, the bags are packed and we are ready to go.
Starting on Monday November 26 2007 we will be leaving Phoenix, AZ, the finish line is Lavonia, GA
We will be taking I-40 East. I have set up a web page that you can watch and see right where we are, this way you don't run up our cell phone bill asking us all day long. :}

My Website Link: http://www.kb7tbt.com/aprs
{or look for the A.P.R.S. link on my home page}
Please feel free to play with all the buttons, if you mess something up just wait till the page refreshes.
There are weather maps, so if you see trouble, I wont mind the phone call.... lol

Without Steve's help and Findu.com my site would not work at all!
http://map.findu.com/kb7tbt-9

Another very cool page is http://aprs.fi/?call=KB7TBT-9
The information is VERY detailed and updated instantly.
{The folks at APRS.FI have done an outstanding job!}

Google Earth Users!
http://www.kb7tbt.com/aprs/kb7tbt-9.kml
{Courtesy of the folks at aprs.fl}

Tracker ID is KB7TBT-9

Any of these 4 links will display our position and telemetry, have some fun and pick the right one for you.

TO: "PROFESSIONAL" RADIO OPERATORS

As we travel we will be happy to work stations along the way.
If you see us close give a listen or a call.

Freqs:
7.200 {+ /-} TS-440 on the dash!
144.390 APRS Yeasu 2600, TinyTrakII KB7TBT-9 WIDE1-1,WIDE2-1 @ 3 min / 30 min parked
{"Switchable to Wide1-1,Wide3-2"}
146.520
446.000

Go Bag:
U-haul with everything I own......
I will post pictures and instructions on how not to go crazy wiring radios and antennas to a plastic / aluminum truck!

TO: KAY - KB5VJR

147.090 W5RGT Choctaw AR OKC Oklahoma Choctaw T141.3
Once we get on the road we will then see where we are and what time it is as we are passing through.
A place to run the dogs and stretch our legs is welcome!

TO: NEGARC:

When we approach Atlanta we will be switching to 147.225 NE4GA Repeater.T123.0
At this point of the trip time frames are impossible to even calculate, you may hear us calling at 2am!...lol
I spoke with the cook and the Georgia Peach Cobbler is a go for the party!

TO: ALL

This E-Mail was sent to many people & places, please reply directly.
If you got this email in error, 10 times, or you just don't care please delete it.

This concludes my QST:

The MX146 transmitter module really isn't a plug-and-play sort of thing, as far as the average user is concerned. It does take a bit of integration, and at the very least you're going to be doing some soldering on a perfboard. It's great for those who want to build their own stuff, though.

If you're not into that, take a look at Jason's RTrak. It's got the transmitter, GPS, and tracker all in one box.

The USB GPS is a USB client that will only connect to a USB host, such as your computer. The USB to serial converters are also only USB clients. There isn't any way to connect client to client. Perhaps encourage the next generation of Tiny Track to include a processor that supports USB-On-The-Go. The would allow you to connect to your USB GPS.

I've been working on this for the OpenTracker, but there's no simple solution. Yes, there are embedded host controller chips, but there is NO standard for how GPS receivers use USB. Garmin, Magellan, and the assorted generics all use different methods. Even worse, most of the manufacturers can't even tell you how the USB stuff works, because they just buy converter chips from places like FTDI and Prolific, redistribute the provided drivers, and never have to worry about implementation details.

I just read on the Garmin website that they have a USB to serial cable to connect the NUVI 300 series to a serial port. They also have a cable that works with the NUVI 600 series. This one actually connects thru the 8 pin port on the bottom. These are listed under Accessories - Data cable.

It's the other direction that doesn't work so great: One end of the USB cable has to have a "smart" host. You can't connect one "dumb" device to another "dumb" device. The smart host has to have software drivers and such and a bit of processing power in order to know how to do the transfer. USB is a complicated protocol.

In general, you need a PDA/laptop/desktop on one end. A USB->Serial adapter requires a computer at the USB end. The other end can be a "dumb" device like a TNC or a GPS.

For most tracking iGates are the final RF destination and help to prevent the digi bounce-around and get the signal to APRS servers faster. If you have 50 miles or more to other iGates in any compass quarter, putting one up will be an asset. All you need is a decent real-time internet connection (DSL or cable will do), a pc, TNC (TNC-X will do), a radio (a handheld is OK) and a decent antenna. Take a look at my setup: http://www.abri.com/sq2000/GPStrack.html

Digis have advantages at some locations - like remote mountaintops with no internet access - you could even run it off solar panels.

Sent: Tuesday, December 11, 2007 8:58:05 AM
Subject: [illinoisdigitalham] SWO Digital and Technical Symposium

The 22nd annual Southwest Ohio Digital and Technical Symposium will
be held from 8 AM to approximately 4:30 PM EST, Saturday, January 12,
2008 in Thesken Hall, on the Middletown Campus of Miami University,
Middletown, Ohio.

Symposium planners have issued a "call for papers" and
presenters. If you have a particular related subject of interest
which you'd like to present, or know of someone who is qualified to
present, please contact Jay Slough, K4ZLE <K4ZLE@...>.

If you have not attended previously, here's some additional
information. This symposium is unusual in that there are no
attendance fees, there is no flea market and there is no commercial
sponsorship. It is not a way to raise money; rather, it is a way to
raise the knowledge level of ham radio-related technology. In
addition to the formal presentations, informal sharing of information
is encouraged through a demonstration room and one-on-one
conversations and small group discussions.

Mark your calendar now and plan to attend the 22nd Annual Southwest
Ohio Digital and Technical Symposium on Saturday, January 12,
2008. Check http://www.swohdigi.org/ for future updates on the agenda.

"You have to think about the cost of running your equiptment 24-7,"

A very good reason to use a small, old, dedicated low power box for the IGate. I know someone who still uses a 386/SX computer for a faxback system--because it has enough power to run that job and that job itself full time. These days, it probbaly begs the issue for someone to develop an IGate that would run on a Windows Mobile or Palm type handheld--they've got a lot of brains compared to old computers, and very low power draw.

It could be done with a smaller device than that, really. One of these days I'll build an IGate with an embedded Ethernet module, if someone doesn't beat me to it. Not that there's a huge market for them, but I need them for commercial projects anyway.

With OpenTRAC it's particularly easy, since it's UDP and you don't even need to worry about maintaining a TCP connection with a host. You just spit out packets and don't worry if a fraction of a percent get lost along the way.

Even regular APRS IS format shouldn't be too hard, since you can get modules with all of the brains required to do Telnet.

4721. Alinco DR-135 questions

Yahoo group: APRS (2007 — 2010)
Date: 2007-12-13 01:02:24 UTC
From: gregwilliams@knology.net
Topic: 4721 Message: 4721

Hello to the group. First time posting.

I've been off of APRS since last year, decided to get back into it and just recently purchased an Alinco DR-135 off of eBay with built-in TNC. Even back then I was pretty much a novice with regards to TNCs.

Does anyone have experience with this radio to offer some help?

I was trying it out with UIView and in the terminal it sees the over-the-air stations on the terminal, but does not display them on the map. Only iGated stations are making it onto my display. I'm thinking my initial commands to the TNC are not properly set.

Also, is there another APRS program besides UIView that would work better with the DR-135?

Any help is appreciated. Thanks in advance.

Yes I believe that is correct.

Radio came without box/manual. It is labeled on the radio as a DR-135 but the TNC is built in.

Just wanted to check, because I sell another TNC board for the DR-135T
that I designed. It'd say Argent Data Systems in the login banner if
you've got one of mine.

From: ka1gl
Topic: 4721 Message: 4725

I'm using a DR-135TP with xastir under linux and it works great. The tnc startup and stop files I'm using for it are basically the same as the ones for the Kenwood D700A. Over the next week or two I plan on doing some testing with UIView32, a DR-135T, and one of Scott's T2-135 tncs. Since I also have the EJ-41U tnc I try that one out also. I'll post my results here if I see no one else has given you an answer.

4726. DIGI suggestions

Yahoo group: APRS (2007 — 2010)
Date: 2007-12-14 22:48:27 UTC
From: Rod Bartlett
Topic: 4726 Message: 4726

If you could use any equipment you wanted for a digi, what would it be?

I am setting up some remote digis, but I am also thinking about using them as crossband repeaters during an emergency. I like the built in APRS of the D700 but I prefer the FT-8800 for crossband.

I will be using Diamond X500HNA dual band antennas.

Towers will be 100 - 180 foot.

I am looking for all thoughts and suggestions.

Thanks

Rod - N8QVR

4727. Objects identified by frequency

Yahoo group: APRS (2007 — 2010)
Date: 2007-12-15 00:47:32 UTC
From: Rodney
Topic: 4727 Message: 4727

I find my Garmin III+ has recently been receiving "invalid waypoint" identifiers which are caused by the the decimal point when using the frequency as identifier of objects such as repeaters. This freezes my receiver and I have to hit the 'enter' button to override this-most cumbersome and dangerous when driving at speed. The NWAPRS site suggests that the owner of the object simply omit the decimal point and write out the whole frequency=e.g. 146.715 becomes 146715. The same information is conveyed but it saves Garmin receivers from freezing up. I also found, however, that there is some resistance to this suggestion so I would like to see a discussion that would resolve the issue for all and eliminate a problem for many Garmin users. Thank You es 73 de Rod,VE1BSK.

If you're using an OpenTracker+ or Tracker2 it should automatically
strip any invalid characters from the waypoint name.

If you're using a Kenwood, you're probably stuck.

Hmm... I guess I could make an inline filter, but it seems like a lot of
trouble to work around Kenwood's problems.

From: Scott Miller
Topic: 4680 Message: 4730

I think any standard 512K x 8 static RAM should work. Seems the DIP
versions are getting rare, though. Here's one at Jameco but it's about $20:

http://www.jameco.com/webapp/wcs/stores/servlet/ProductDisplay?langId=-1&storeId=10001&catalogId=10001&productId=157358&pa=157358PS

I've got a whole tube of SRAMs here that cost a fraction of that and
would probably work only they're surface mount types and you'd have to
solder them to an adapter. Even the surface mount chips were hard to
find in a 5-volt version.

4731. Looking at getting started

Yahoo group: APRS (2007 — 2010)
Date: 2007-12-16 12:08:57 UTC
From: joejulie1
Topic: 4731 Message: 4731

I'm looking at getting started in APRS, but not sure what I really need. I've looked around the web and like most things in the HAM world there is lots of info but no one place to find it all. Maybe I can get it all here.

I currently have 2 radios, a Yaesu VX170 (Handheld) and Yaesu FT8900 (Mobile).

First question is that since the FT8900 operates like 2 radios, could I have the APRS operating on one side and still operate voice on the second? I know that I can only operate on one side at a time so this may not be possible.

Second question is that if I can't use the ft8900 and still operate voice, could I use the vx170? Even looking for data cables, the only site I found said that they had cables for everything except the Yaesu's with the screw in connectors (vx170 has one such connector).

Also where can I look to purchase the equipment needed (and what do I really need).

Any options you can offer for getting up and running with minimum cost output as possible. I want to do it right, but only just bought the 8900 so money is tight.

Thanks in advance

73

Joe

I imagine that people smarter about APRS than I will respond, but I want to clarify a few things in order for the folks here to best advise you.

#1 Does your FT8900 have a data jack on the RF deck and is there a "Data Band" option somewhere in the menus? We need that information in order to tell you if what you envision is possible with that radio, and you will likely find the answers in the manual. If it doesn't you could use the VX170 but with the normal range limitations associated with a handheld. My Kenwood TM-V7A has these and I operate just as you would like, voice on the right-hand band and data "in the background" on the left. The only thing is the voice band cuts out when the TNC asserts PTT through the data jack, but the APRS transmission is so brief that it just sounds to folks on the other end like my finger slipped off the PTT button.

#2 What do you want to do with APRS? My car has an Opentracker (http://n1vg.net/opentracker) transmit-only device that takes position information from an attached GPS, formats it as an APRS packet, and squirts it out to the network through the aforementioned V7A. My wife's car on the other hand has a Kenwood TM-D700A which shows distance and bearing to received stations on the display, and my base has a Kantronics TNC that receives APRS packets and plots station locations on a map.

Well, let me see if I can answer your questions......

There is a data jack in the back of the radio (ft8900) and the manual for the VX170 says it will interface with a packet TNC. I have the cable for the FT8900 as I use it to load frequencies in from my laptop.

I would rather use the VX170 if I can, but if there is only a minor interruption when the packet it sent then I could likely use the FT8900 (How often is the packet sent)?

I guess I'm so green at this that I'm not sure what I want. I would like to see the most data possible. I have a Garmin 60CSx gps so I'm hoping that I could use that to send the gps data. All of which in my vehicle. Would be nice for it to be displayed on a web site somewhere. I know that's possible, but not sure on the set up.

Also, what am I looking at for costs (I'm in Canada if that helps).

FWIW I also run an Opentracker in my Jeep, attached to an el-cheapo
GPS I bought on closeout and a mobile radio, all but the GPS and
2-meter antenna are installed inside an ammo-can.

I run a separate 2-meter mobile radio and antenna for voice. I set
the Opentracker to do Base-91 compressed positions to keep the
transmissions very short. I also set it for SmartBeaconing and
CornerPegging so that I get a nice trail laid down without having to
transmit at a fast fixed rate: The transmit rate changes with my
speed, plus it also transmits when I corner.

For your application you might want something like a Tracker2 TNC,
which can plot the positions of other APRS stations onto your GPS as
waypoints. The Tracker2 and the OpenTracker TNC's are made by the
same guy, Scott Miller, N1VG, in CA.

At home I run a TNC-X and another mobile radio, attached to a Linux
box running Xastir.

Just for getting started you can try running an APRS client over the
internet instead of on local RF, then perhaps add a TNC and radio to
that station later. If running only on the internet though you
depend on local igates to get your mobile packets into the internet
for your home station to then be able to view them. If you have a
TNC on the air you can receive them directly and/or _be_ a local
igate if there aren't enough in your local area.

You use a secondary station identifier (SSID) - that's the part after
the dash in the callsign. For example, I use N1VG-6 for my car, N1VG-2
for my weather station, N1VG-11 for a high-altitude balloon, and N1VG-1
for my home station.

The SSID was built into the AX.25 protocol. It's only a 4-bit field, so
valid values are 0 (which is the default and usually isn't displayed) to 15.

You can use the SSID field to differentiate between multiple
transmitters using the same callsign.

4738. Re: [APRS] Re: Looking at getting started

Yahoo group: APRS (2007 — 2010)
Date: 2007-12-22 07:27:12 UTC
From: Rahn Abbott
Topic: 4731 Message: 4738

I am fairly new to this whole APRS thing but I am learning quickly too. Here's a question that will make a huge difference in your setup. Do you just want to track yourself? ie. your wife can look at a website and see where you are. Or do you want to be able to track other stations as well? Here's the basics of how it works. And when I say basics, there is a lot more going on but it will give you an idea. Someone sends out an APRS packet. It goes either directly to an I-gate or it goes to a digi-peater that makes it to an I-gate and the packet eventually gets routed to the internet where you can look up the call sign at www.findu.com
Now if you were to listen to that packet on the air it would sound like a combination of static and that high-pitched screeching sound your dial-up modem used to make. So your radio receives that horrible sound and passes it to your audio output. If it just goes to the speakers it sounds horrible. However, you could use your external speaker jack and route that horrible noise to a TNC. The TNC makes sense of the horrible noise and turns it into characters that are then output to a computer and eventually a computer screen with the aid of a program like UI-View. I am not sure of the 8900 but I have an older 8500 and the data jack is not a built in TNC like the Kenwood TM-D700A but rather it is a high quality audio output that still needs a TNC to make sense of the noise.
Then if you want to send out a data packet the exact opposite of that happens. A GPS supplies the TNC with positioning data. The TNC takes that data and appends some other data on it like routing information and your call sign etc... turns it into a horrible sound and sends it to your radio to transmit. In theory, you should be able to use your handheld by having the TNC connected to the same jack you would normally put a headset in. The headset jack(s) would send and receive audio from the TNC just the same as if it has speakers and a mic on a headset. The data jack on the mobile radio would also have the same audio input and output. Consult your manual for which pins do what.
If you leave the stock antenna on the handheld you will have limited range in both send and receive capabilities. If you use a better antenna, for instance the same antenna you would use on a car with an adapter to make it fit the handheld, you will probably not notice much difference between the two as far as receive goes, You make still notice a bit of a lack in the sending department. However, on my mobile I am only running 5 watts on APRS and am hitting an I-gate close to 40 miles away. So you will probably do just fine with the handheld.
I think that addresses most of the questions, and I am sure you will have more. And I am sure there are people here more qualified than I who will jump in and correct me. But hey, that's how the life works.
Rahn
W7DOA
73
P.S. I downloaded the manual for the VX-170 and on page 11 of your user

manual it has the set up for making a TNC connection to the handheld radio.

From: joejulie1
Topic: 4731 Message: 4739

Thanks for the response.

The next question(s) I have are, how do I let the TT know where I'm going to pick up the data, is that automatic? I went to FindU.com but I couldn't find where I would actually see a station on a map? I could go to googleaprs.com and the stations in my area. In the example that you gave.... where would my wife go to see where I am?

I would like the option of being able to receive signals within my area and plot them onto the gps. Not something I would want all the time because that would fill my waypoint memory pretty quickly and I usually have it full of Geocaches.

What would be really nice is to find someone that has the same set up(s) as I'm looking at to know what they have for cables, etc. Just in case there is someone out there, here again is what I have:

Radios are FT8900 and/or VX170 and the GPS is a Garmin 60CSx

Another question would be about powering the set up (using the VX170) when I'm hiking or away from my vehicle. Both the radio and the GPS have batteries so that's ok, what about powering the TT?

Thanks

Joe

I am not too familiar with the TT but I believe they have their own battery. I didn't even know about googleaprs pretty neat site. However, I use http://www.wulfden.org/APRSQuery.shtml where you can search for one call, specifically yours. Your wife could see you on a map without seeing everyone else. As far as seeing waypoint on your GPS, not sure how it's done. I don't think it's too hard. I have never explored that for the reason you mentioned. I already have too many waypoints and don't need to fill it up with more.

Subject: Satgate settings.
To: aprssig@...

I now have a radio and TNC set up for I-gate. However, my local area is fairly well covered with digi's and I-gates. I think it would be a waste of resources to put yet another I-gate on the net. So I have made the decision to use it as a dedicated Satgate. I started to get interested in the GO-32 sat. But when I realized my TNC won't run at 9600 I scrapped that idea. Plus, I have been listening on 435.325 and have not heard a peep. Two strikes against GO-32. I have successfully captured packets from ISS. But I am looking for suggestions on which sat to gate. Or are there a couple different ones on 145.825 which is where I am currently hearing ISS packets.

Next question. I am hooked to a server, aprsfl.net:10152 specifically and UI-view says that packets are being routed to the net but I don't think they are actually getting where they need to be because I don't see them showing up on the net as though I gated them.
I don't want to cause problems so I need to know, which server(s) should I hook to if I want a satgate, and what should my settings be on UI-view?
BTW, my location is in the 45N 112W area, I would not even be opposed to gating other satellites, as long as they are not running 9600 baud. And preferably VHF since it doesn't seem to be effected by doppler as much as UHF is. I don't know how much info you can gather about my set up already but my call is W7DOA. Thanks for any help you may be able to give. I just don't want to cause problems with the gate. I found a website that supposedly told you how to set up a satgate but the servers they told me to use were not able to be connected to.
Thanks again
Rahn

4742. KPC 3 Ver 6.0

Yahoo group: APRS (2007 — 2010)
Date: 2007-12-24 03:40:18 UTC
From: wr hatfield
Topic: 4742 Message: 4742

I apologize for probably asking an old question. I would like to know if it is possible to set up a KPC 3 ver 6.0 to do APRS? The problem is I am hearing the packets and my machine is IDing but I have not seen my call sign on any of the APRS maps. Any thoughts as to why this is? Thank you in advance and by the way Merry Christmas.

Wayne, kd5jjp

What are you using it to do?

Are the "APRS maps" you refer to the web ones like findu? If so, it is possible your system is working, but you are just not making the RF trip to an iGate.

If you could describe your setup and what you are trying to achieve that would be useful.

Jim, G1HUL

Subject: [APRS] KPC 3 Ver 6.0

I apologize for probably asking an old question. I would like to know if it is possible to set up a KPC 3 ver 6.0 to do APRS? The problem is I am hearing the packets and my machine is IDing but I have not seen my call sign on any of the APRS maps. Any thoughts as to why this is?
Thank you in advance and by the way Merry Christmas.

Hello Jim and the group,

Just to let you know I finally showed up on FindU.com. I guess you were right about the RF getting to a igate. to answer your question I am using a KPC 3 Ver 6 the chip inside says that it was made in 1996. I have hooked it up to a Kenwood TM-V7 that I brought in 2000. What I am trying to do is set up a digi for some friends, I do not have the capability to do APRS mobile quit yet but I will be working on it later. The igate I am trying to hit is about 20 miles away, my tower is 45' tall, the hill I am on is about 400' above sea level; one of the tallest in our Parish (we have Parishes instead of counties in Louisiana). Thank You Jim for your help even if there was not very much quit yet , I will be calling again if I run into any trouble. Hope you have a Merry Christmas and a Happy New 2008. 73 for now

4745. Will You Let FCC Kill PACTOR3?

Yahoo group: APRS (2007 — 2010)
Date: 2007-12-27 05:01:18 UTC
From: rrath@charter.net
Topic: 4745 Message: 4745

I hope this is ok to post.
Rod
------- Forwarded message follows -------

This was Posted on the WL2K Emcomm User Group.

A terrible petition now at FCC USA seeks to eliminate
all advanced digital data modes such as PACTOR3, ALE, Olivia,
MT63, ALE, OFDM, fast PSK, MFSK and others.

We only have a few days, by January 1, to respond and kill it.

Only you can save PACTOR3, by your comments to FCC.
It only takes a few minutes on the web.

Click here, enter proceeding, RM-11392 and your commments:
http://fjallfoss.fcc.gov/prod/ecfs/upload_v2.cgi

Fill in the appropriate parts of the form,
then write your comments in the lower part
"Send a Brief Comment to FCC (typed-in)"

Here are suggested examples of comments, below.
Don't let FCC kill digital data on ham radio.

73 Bonnie KQ6XA
==========
Feel free to copy and paste any (or all) of these into your comments.

1. I oppose the RM-11392 petition!

2. The RM-11392 petition is very bad for the Amateur Radio Service.

3. The RM-11392 petition seeks to destroy digital data technology
advancement in the Amateur Radio Service.

4. The RM-11392 petition's proposed 1.5kHz bandwidth limit on data
emission is too narrow for established international standard
transmissions and equipment bandwidths used by the Amateur Radio
Service.

5. The RM-11392 petition is an attempt to kill innovation, technology
advancement, and emergency data communications in the Amateur
Radio
Service. Please do not let this happen.

6. The FCC Amateur Radio Service's automatically controlled data
sub-bands are already too narrow for the huge volume of traffic that

runs on them. If a limit of 1.5kHz bandwidth is applied, it will severely hamper the ability of amateur radio operators to share these small band segments efficiently through rapid data methods.

7. There is a huge installed base of Amateur Radio Equipment, and millions of dollars of monetary investment by thousands of Amateur Radio Operators that use HF digital data systems with more than 1.5kHz
bandwidths. This investment by FCC-licensed operators would be taken
away or rendered useless if the objectives of the RM-11392 petition were to be adopted.

8. Several of the primary established HF emergency communications networks currently in service and utilized by thousands of Amateur Radio Operators in USA would be totally eliminated or hobbled if the objectives of the RM-11392 peteition were to be adopted.

9. The Amateur Radio Service relies upon international communications
standards. Many of the present digital data communications standards require bandwidths in excess of 1.5kHz. The normal amateur radio service bandwidth limit by governments of other countries is 6kHz.

10. Thousands of licensed Amateur Radio Operators would be disenfranchised if the objectives of RM-11392 were to be adopted.

11. The RM-11392 peteition is comparitively similar to an Analog Cellular Phone service entity trying to eliminate newer Digital Cellular Phone service. The fact is, Amateur Radio is now using faster time-multiplexing digital methods to enable more stations to efficiently use the same frequency channels simultaneously or in rapid succession. These time division techniques require at least 3kHz of bandwidth.

12. RM-11392 peteition has not presented a compelling need to change
the rules for Automatically Controlled Data Stations on the HF bands.

END

------- End of forwarded message -------

4746. Re: [APRS] Will You Let FCC Kill PACTOR3?

Yahoo group: APRS (2007 — 2010)
Date: 2007-12-27 05:56:34 UTC
From: Scott Miller
Topic: 4745 Message: 4746

Read the original document before you make up your mind:

http://fjallfoss.fcc.gov/prod/ecfs/retrieve.cgi?native_or_pdf=pdf&id_document=6519008574

Keep in mind that this proposal came from a ham (Mark Miller, N5RFX) -
I've met him, he's an avid user of digital modes, and I don't think he's
out to destroy data on HF.

The petition calls for a return to rules that were in force prior to
2006, and clarification of permissible data modes in the RTTY/CW/data
sub-bands. It's not about keeping advanced modes off the air - it would
seem to be more about keeping automated PACTOR3 mailboxes and similar
overly wide modes out of the portions of the band reserved for narrow
bandwidth modes. Frankly, that sounds like a great idea to me - reserve
those portions for efficient modes like PSK31 and CW like they were
intended.

I don't want to start a debate here (I'm sure the debate is already
raging elsewhere) but please go read the proposed rulemaking yourself
before blindly sending anything to the FCC. Mark does a good job of
explaining the reasoning behind it and its anticipated impact and it's
worth a read whether you agree with it or not.

And as for letting the FCC 'kill PACTOR3' - all bandwidth questions
aside, that's just fine by me. I don't think closed, proprietary
transmission modes have any place in amateur radio. That goes for the
AMBE codec in D*Star as well. Now THAT is a proposed rulemaking I'd
like to see - require that any transmission mode used on amateur bands
have a full and complete specification published and be free of
licensing restrictions, at least for amateur use.

That's another issue entirely, though.

4748. Mark Miller FCC Petition

Yahoo group: APRS (2007 — 2010)
Date: 2007-12-27 17:29:09 UTC
From: genied7
Topic: 4748 Message: 4748

With full recognition that any modification to the complex FCC rules covering amateur radio is bound to have unfavorable consequences for one part of the fraternity or another, it seems to me, as a "steath station operator" that rule making which preserves certain portions of the HF bands for narrow band data communications is a favorable objective.

With reference to my data on the throughput and copy accuracy on various digital modes as reported in the 26th ARRL/TAPR DCC Proceedings, some of the available digital modes appear to use increased bandwidth more effectively than others but the narrow band modes appear to be quite adequate for "antenna limited" (i.e. "stealth") operations.

True, one can use a good filter to get away from the "blanking" effect of a strong local wide band digital station operating closely adjacent to narrow band digital mode communications but one wonders if that should really be necessary given the band options that are readily available.

For what it is worth.

From: Scott Miller
Topic: 4749 Message: 4750

The OpenTracker+ is my creation so I might be just a bit biased, but I'll give you a quick summary of why I think the OT1+ is a better deal than the TT3.

First, firmware updates are free and easy to get. It takes a few seconds to select the firmware image you want (standard tracker, KISS TNC, Peet Bros WX, 1-wire WX, etc) and download it straight from the Internet to the tracker with just a null-modem cable - no need to pull the processor or have a special programming device.

Second, it's got receive capability. The TinyTrak4 will have this as well, but I don't think it's done yet. In tracker mode, received positions get sent to the GPS receiver as NMEA (and Magellan) waypoints, so the stations show up on your GPS screen, assuming your GPS receiver supports NMEA input.

The receive capability also lets you use the tracker as a very simple KISS TNC. It hasn't got a ton of buffer space and it's not the most sensitive TNC out there, but it works well enough that they've been used in IGates.

The OT1+ has a larger regulator than the TT3 (the same type as the TT3Plus actually) so it's able to power a 5-volt GPS receiver directly.

Oh yeah, it also gives you temperature and voltage telemetry from on-board sensors. And if you're so inclined (and comfortable with C programming), you can download the complete source code and make your own modifications.

There's a lot more, including some more obscure telemetry functions that won't interest the average user, and there's very little the TT3 does that the OT1+ doesn't.

Both the n1vg.net and argentdata.com sites are in the middle of a major restructuring right now, so here's the product page in case you have trouble finding it:

https://www.argentdata.com/catalog/product_info.php?products_id=65

And here's a somewhat out-of-date brochure from Dayton:

http://n1vg.net/opentracker/OpenTracker_flyer.pdf

It's also $6 cheaper than the TT3Plus kit (bulk discounts are available =]) and, in my opinion anyway, easier to assemble.

Let me know if you have any questions.

I've used both extensively and am strongly in favour of the OpenTracker.

Main reason is that the TinyTrak is prone to locking up in the presence of strong RF, which can get into it via the GPS cable etc. Filtering (extensive in my case - with metal boxes, chokes on inputs etc. etc.) has only been partly successful. OT has never locked up, even deliberately trying.

The OT firmware also just feels more mature and complete, with the TT having annoying quirks.

My use has been in emergency comms, so both have had plenty of "harsh" real world testing.

No connection with either, jut a very happy OT user!!

I just wish that they made a decent TNC that has USB as my Sony Viao has no serial port and I don’t like using a serial to USB adapter. Elcom has some decent USB TNC that I am looking at using for APRS as they run USB and are about the same size.

The TNC-X has an optional USB module. I opted to keep the USB guts external - I sell adapter cables for my trackers. At some point I'll add USB support (I've already got a working prototype, but it's not high on my priority list) but I plan to do it through the processor's USB interface rather than an off-the-shelf converter chip. It gives more flexibility and lower cost, but it means a lot more development work.

For my latest project (a simplex repeater) I'm not even using a serial interface for programming. It just has an audio connection - you'll be able to program it from a PC, CD player, or whatever. Sort of like back in the VIC-20 days with data cassettes. =]

I've owned past revisions of the Tiny Track and wasn't too fond of the hardware replacement to upgrade. The Opentracker is much easier to implement, upgrade and customize. I assembled two of the OT1+ units and is very easy (about 45 minutes build time). However if you don't want to tackle stuffing and soldering the boards, the upcharge for a fully assembled and tested version is very modest. Opentracker has a good partnership with RPC Electronics, who also sells the OT's in kit or assembled form. In my opinion, support is much better with the OT's and has a very active forum where users can exchange notes, ideas and support from the designer.

Useful related OT links:

Thanks everyone for your informative replies. I'm definitely sold on the OpenTracker now. Now, I just need to decide which whether to get the standard OT or SMT version.

Argent Data Systems also has a Puxing PX-777 VHF Handheld Radio for $90. Has anyone had any problem with interfacing OT with it? My main goal is for vehicle tracking. Is that radio sufficient? or will the SRB MX146 Transmitter be enough? Thanks again!

The only deficiency I see in the PX-777 for tracker use is that it doesn't have a convenient external power jack - if you want to use it with external power, you have to have it in its drop-in charger. On the other hand, the Li-ion battery lasts a long time.

The MX146 takes some integration work. RPC Electronics is about to start taking orders for the RTrak, though, which has an SMT OT1+, an MX146, and Copernicus GPS module all in one aluminum enclosure.

Also, version 1.5 of the OT1+ SMT board (not on the site yet) will include support for setting frequencies on the MX146.

I just got samples in from Taiwan today of a new 2-meter rig that just got FCC certification. The internals seem to be very similar to the PX-777 (all of the menus are identical, for one) but it's more rugged (MIL-STD-810 certified) and comes with a 1600 mAh battery pack, and an optional 2000 mAh pack. Still no external power jack, though.

It'd be at least $10 more than the PX-777, so I'm going to have to do some testing to see if it's worth carrying. It needs some new default settings if nothing else - the default repeater split is 10 MHz, which puts you out of the 2-meter band!

For a tracker radio you can throw in a box and forget, it's hard to beat a junker HTX-202 from eBay. They're big, they're clunky, and they're ugly, but they're cheap, they work, and they take external power.

Hi Andy:

If you are looking to make your tracker somewhat portable and don't have a lot of space, then a small HT is ok. However if it is something that you are thinking about leaving in the car full time, then consider getting a surplus 2-meter transceiver with 25 watts or more. QRP from an HT is ok if you have some high altitude or wide coverage digi's (or plenty of fills). These radios are plentiful on eBay and usually lack PL tones or a lot of memories, which make their market value somewhat low...but great for the packet and aprs community. The Alinco DR110, 140 or 1200 are great radios for APRS and are relatively small. I took an Opentracker and an Alinco radio and tucked it on a small plastic box and placed it behind the seat of my pickup. I direct connected it to the battery with a relay that drops out after I remove the ignition key or hit a kill switch if I don't want to be tracked.

If you are handy and want to keep the package small and portable, I suggest looking at the first generation synthesized HT's as they are cheap and easily hacked. My favorite is the Icom 2AT, which I completely remove from it's case and mount in a box along side the OT. It does require some handy work such as putting a small voltage regulator to directly power the unit (since they operate from 8 to 10 volts). These are usually cheap ranging from $20 to $50, but will give you 1.5 watts on APRS.

If it's "off the shelf" stuff without breaking out the soldering iron and dremel tool, then I think Argent may have everything you need to cable up one of his radios or any late model transceiver.

73,

Tim

Scott,
Been looking for a TNC that I can use for APRSPoint on my sony while traveling. Does the TNC support the program?
Thanks

Peter Dakota Summerhawk

Subject: Re: [APRS] OpenTracker vs. TinyTrak

The TNC-X has an optional USB module. I opted to keep the USB guts external - I sell adapter cables for my trackers. At some point I'll add USB support (I've already got a working prototype, but it's not high

on my priority list) but I plan to do it through the processor's USB interface rather than an off-the-shelf converter chip. It gives more flexibility and lower cost, but it means a lot more development work.

For my latest project (a simplex repeater) I'm not even using a serial interface for programming. It just has an audio connection - you'll be able to program it from a PC, CD player, or whatever. Sort of like back

in the VIC-20 days with data cassettes. =]

As long as the program supports KISS - I'm not sure if APRSPoint does.

Andy-
"...for vehicle tracking. Is that radio sufficient?"
That really depends on how many receivers are in your area, or rather, how much power you'll need to hit the ones that are around. In some locations you can use a 50W radio and a 1/4 wave rooftop antenna and still be invisible. In others, you can use flea-power and still be picked up.<G> You might want to take a look at your area with some APRS software and see if there are others being picked up, and if so ask them what they are running. Needless to say, effective output power is what counts and optimizing your antenna choice may be the most important thing.

Scott-
Plain Mil-Std-810 is an obsoleted 1962 spec.
http://www.dtc.army.mil/pdf/810June1962.pdf
Of course the Chinese sources must be trustworthy and they've really submitted that radio to a certification lab for one of the specific newer levels of that standard, haven't they? (Cynical hairy barbarian from the low kingdom, ain't I?<G>)

Find out how you can get spam free email.

Before I got hooked on XASTIR (Linux APRS), I was looking at switching over to APRSPoint since I already own MS Streets and I like the way the maps look/work. Plus, the program is being actively developed (Unlike UI-View). I emailed the author about KISS and I was told the program did NOT support KISS and there was no plans in the future to do so.

Since I have plenty of OpenTrackers, Tracker2s and TNC-X's lying around, I prefer to use a program that supports KISS. Nowadays, it doesn't make much sense to dedicate a $180 TNC with 1000 functions to just operate an APRS station in Converse mode. KISS really is the way to go. Deffinently alot cheaper!

KISS is the better interface method by far - not to say that it's the best (there are improved versions out there), but it's more reliable than using converse mode.

Converse mode was NOT designed for machine to machine interfacing. It's intended to be used by a human operator. TNC designers (myself included) have made attempts to keep a relatively standard look-and-feel, but there are differences. Even if they're not noticeable to a human user, they're enough to throw off a computer.

There are also plenty of things that are undefined - like how to handle extra linefeeds in packets or non-printable characters. It's far too easy for the program and the TNC to get out of sync.

KISS is a very simple, straight-forward interface. It defines a very simple state machine, and keeping the TNC and program in sync is trivial.

I think the real reason you don't see KISS in some APRS programs is that the programs are written in Visual Basic or a similar language that doesn't allow easy access to binary data. It takes a different set of tools to manipulate 8-bit data streams, while in converse mode you can (when things work right) get by with the sort of string manipulation any programmer who's ever taken a high school BASIC programming class would know.

I don't mean this as a slight against anyone, but I have trouble taking any modern APRS application seriously if it can't handle KISS, or at least an AGWPE interface.

4765. PicPac replacement

Yahoo group: APRS (2007 — 2010)
Date: 2007-12-30 17:23:49 UTC
From: k7rkt
Topic: 4765 Message: 4765

With the Byonics PicPac out of production, what other commercially available solutions exist for an integrated APRS decoder/display? There are several products like OpenTracker+ and TT4 that can decode packets and shove waypoints to a PC and/or handheld GPS, but that requires yet *another* set of cables and battery powered devices.

I'm aware of HamHud, but those devices seem to provide more functionality then needed, and cost more than my $100 target price?

I'm looking for another solution that integrates the display, decoder and battery power all in one device like the PicPac used to provide -- is there anything like this out there?

What about pairing something like the OpenTracker / TT4 with a serial enabled LCD like those available from sparkfun? They all seem to expect TTL level inputs, so some sort of level converter would be needed, but that seems like a pretty straightforward solution.

Comments?

I actually wrote a mod for the OT1+ firmware that lets it use a standard parallel LCD. So far it just displays the to/from line and the first part of the packet. Here's a picture:

http://n1vg.net/opentracker/images/ot1plus-display.jpg

Getting it into a case with a battery is up to you at this point. Doing a one-off wouldn't be that hard if you're good with a Dremel. A 9-volt battery would power it for several hours at least and wouldn't require any extra circuitry.

It should work with any HD44780-compatible LCD module that takes 5 volt inputs. I just grabbed the first thing I found in my junk box that had a convenient pin header for breadboarding.

Agreed... 20 watts is about the minimum I'd use for a mobile tracker
around here.

They sent a copy of the testing certification, for what it's worth. I
trust the Taiwanese manufacturers just a hair more than those in
mainland China, which isn't much. It does seem to be more rugged than
the PX-777. Only dropped it once so far, though, and I don't intend to
destroy my samples finding out. I'm just not convinced it's worth the
extra cost compared to the Puxing.

4768. APRS DIGI suggestion?

Yahoo group: APRS (2007 — 2010)
Date: 2007-12-31 02:34:30 UTC
From: Rod Bartlett
Topic: 4768 Message: 4768

If you could use any equipment that you wanted for an APRS Digi, what would it be?

I have access to some 180 foot towers with a dualband Diamond antenna on the top. I would like to setup an APRS digi on each of these and possibly have crossband repeater capability also in the case of an emergency.

I like the builtin APRS of the D700a but I like the ease of the crossband features of the Ft8800 better.

I am open to all suggestions.

Thanks

Rod - N8QVR

4770. Convert MIC-E messages to lat-lon

From: no6b@no6b.com
Topic: 4770 Message: 4770

Does anyone know of a program/script/algorithm to extract lat. & lon. from MIC-E strings? I have the raw data saved from WinAPRS in a text file & would like to load it into MS Streets & Trips. I have the APRS protocol reference v1.0.1 that describes the format & was about to write my own program to do this, but would rather not reinvent the wheel if one was already available, & it doesn't look like WinAPRS can save lat/lon. Thanks.

While I agree that VB wasn't "built" with bit-level operations in mind,
it's quite doable using the byte data type. If you're forced to take data
in string format, the CopyMemory API function can be used to transfer the
bits straight into a byte array. I used this trick in the past to increase
program speed (back in the pre-GHz CPU era, when it actually mattered),
since string ops in VB are slow compared to boolean & integer.

Yeah, I've been forced to do binary stuff in VB myself once in awhile,
but it's not fun. I just can't think of any other reason a programmer
wouldn't bother supporting KISS.

4777. APRS for Rovers during contest

Yahoo group: APRS (2007 — 2010)
Date: 2008-01-01 02:22:57 UTC
From: k5omc
Topic: 4777 Message: 4777

Hello,
I have heard that the ARRL may start requiring the rovers to have APRS to post their position during contest on VHF and higher frequencies. If that is so I need to know more about it so I can be ready because I rover from time to time. I usally take a reading from my Explorist 300 which is not interfacable with a PC and log it.
Can I enter my Lat/Lon mannually or do I have to up grade my GPS? I only know I need a PC and a GPS coordinates. I don't know what software to run or mode on the rig to select.
Can someone assist me on this and will it load the system down during contest weekend and work properly?

There exists a Perl script written by Ian, the APRS spec editor,
that decodes lots of APRS packets. You should be able to snag the
bits of code out of it. I have a copy if you can't find it with a
quick Google search. I think it might be on tapr.org somewhere.

Nope, no battery. The out-of-production PocketTracker could have a
9V battery inside the Altoids tin with the transmitter/TinyTrak
unit, and some of the newer all-in-one devices like the RTrak might
have that capability (haven't checked), but the standard
OpenTrackers and TinyTrak units don't have any batteries at all.

4781. Interference to 2m radio on the car

Yahoo group: APRS (2007 — 2010)
Date: 2008-01-02 23:21:08 UTC
From: scottbomb
Topic: 4781 Message: 4781

Greetings all. I'm new to this forum and new to APRS altogether. The Tinytrak 3+ is on it's way in the mail and I'm thinking of putting it in the trunk of my Honda Civic. I'm suprised my question hasn't already been asked (I've search for it) but if it has, I apologize - I just can't find it.

I use an Icom 706Mk2G in the car, connected to a dual-band antenna for 2/440 and I use Workman (Hamstick clones) for HF. I'm wondering if people have been successful in mitigating interference from the APRS beacon to the other radio in the car. I've heard that I'm gonna need more than a watt from the HT in the trunk so I've got a 30 watt amp ready to go. However, I'm really not comfortable running that much power so close to the the dual-band antenna. I can only seperate them so far, maybe 5 or 6 ft. at the most.

Thanks in advance,
Scott - n0xmz

4782. Pactor patent numbers

Kind of interesting the first day I start reading this group
someone else is asking my question for me.

Anyway I am trying to set up almost the same thing but was kind of
curious JoeJulie1 are you using the ft-8900r as your base station,
are you planning on using it to attach to your computer all the time?

Thanks
Ray

From: no6b@no6b.com
Topic: 4784 Message: 4784

I have APRS+SA v2.28 & Street Atlas 9 installed, but can't figure out how to get a map display from APRS+SA. I have APRS+SA displaying data in the positions window (though I can't seem to delete any of the stations to make sure I'm still receiving data via the internet), but there doesn't appear to be any "link" to SA9. All the help files I've been able to google have been of no help, so any assistance here would be appreciated. Thanks.

Thanks, Curt. I'm not a Perl person, so I sat down & wrote a VB6 program
to do the conversion based on the APRS 1.0.1 spec. It's all done except
for the course translation, which I personally don't need. But since
that's all that's missing I think I'll throw that in as well & post the
result to the files section this weekend.

I had a problem with the TM-G707 APRS 50 watt TX getting into a car radio -
the FM stereo! I had to cut the coax leading to the AM/FM radio antenna &
install a filter (standard CATV VHF mid-band block).

I have heard of front-end damage caused by 2 in-band radios using close-in
mobile antennas, so your concerns are legitimate. My best guess is that 10
watts @ 5 ft. separation is safe, but beyond that is questionable. Only
straightforward solution I can think of is a notch cavity on the '706 tuned
to 144.39. Just a 6 dB notch should be enough to protect the front-end.

If you can think of any way to squeeze another foot or two of separation,
that would make a big difference as nearfield coupling losses increase
dramatically with small increases in antenna spacing.

Good advice Bob, thanks. I'm gonna try it at 5 watts (HTX-202) at first and see how that works. I'll probably want the 35w amp anyway so I may as well look into building the notch filter. I was trying to avoid that because I was afraid the notch would be too wide and prevent me from using 144.2 SSB but if that is the case then I'll just have to live with it. I wish the APRS digipeaters were on 440 but I guess I can't have my cake and eat it too. :o)

I'm using it in the vehicle. Only looking at position reporting so
the use of a TinyTracker or OpenTracker will do this for me and no
need for a computer. These (to my knowledge) are for tracking only
and don't allow for the other benefits of packet communications.

From: Broncus
Topic: 4731 Message: 4792

I had a FT-8500 and was never happy with using one side for APRS and the other as normal. The packet data would be transmitted onto the 'other' side. The 'other' side was used for 2M and 440 activity.

My final answer was to use a FT1500 ($110 new at the time) for packet and leave the FT8500 for normal use. The FT1500 has a data port which is nice. The FT8900 is basically the same as the FT8500 but with two other bands available for use.

If you use the VX-170 (which can be done) I would probably use a 25 watt amplifier as well. Here is New Hampshire the coverage seems spotty. Radio Shack had one (HTA-20) which can be found on EBay easy enough and for a reasonable price.

You need a TNC as well. The Tracker2 and the Tinytrak4 look to be decent options for a low budget setup. I am replacing a Kantronics KPC3+ with one of them. I had used the TT3 but I ended up wanting two-way data. so I recently got a eval version of the TT4. It is real close to prime time. It can be purchased as a kit when it is ready.

http://www.byonics.com/tinytrak4/
http://argentdata.com/products.html

Have fun!
Fred

Hi Scott,

I run an HTX-202 into a 25W amp and Hustler 5/8 mounted on a lip mount on the hood and a Yaesu FT-8800 with a Comet 2x4 dual band antenna on a trunk lip mount. The APRS rig severely desenses the FT-8800, but so far no damage to either rig and I do run the Yaesu at 50W occasionally.

The last statement is mostly correct.

None of the TinyTrak's except for the soon to be in production
Tinytrak4 have receive capability.

I believe the OpenTracker1+, and I know the Tracker2 and T2-135
TNC's have receive capability. You can use any of these to plot
waypoints on your GPS showing the locations of received APRS
stations, just like you can on the Kenwood APRS radios or Xastir.

Tinytrak4/Tracker2/T2-135 can all do KISS mode as well, letting you
use the TNC's for things other than APRS. Be careful about buffer
sizes though as that may limit their use in some cases (for instance
long TCP/IP packets).

Some of them can do digipeating as well. In fact the T2 & T2-135
can do digipeating while tracking, or digipeating while
sending/receiving KISS packets to a TNC. In fact with 2 serial
ports, one for the GPS and one for the PC, you may be able to do all
at once (check the docs).

The OT1+ does have receive capability. It's software-based as opposed to the T2's hardware-based (2211) demodulator. It works remarkably well for such a low-power DSP platform (8 bit CPU, ~2-3 MIPS) and some people even use it on IGates.

In tracker mode it uses the RX capability to generate NMEA waypoints for incoming stations. It can be used as a generic KISS TNC if you load up a different firmware image. That process takes about 20 seconds and doesn't require any configuration.

> use the TNC's for things other than APRS. Be careful about buffer
> sizes though as that may limit their use in some cases (for instance
> long TCP/IP packets).

Yes, none of the OT1+/T2 units are suitable for large packets or lots of outgoing packets in quick succession (i.e., in the same transmission). The T2s have plenty of buffer to handle incoming APRS packets for digipeating and should keep up with any physically achievable network load. The OT1+ buffers exactly one packet at a time, so it's a little more limited. In practice, it's perfectly capable of keeping up with an almost constantly busy channel thanks to the fact that incoming data is at 1200 baud (with a lot of overhead) and outgoing is at 4800 baud.

I think just about every combination of console/KISS/weather station/digipeater is supported, though I won't promise there aren't any bugs in specific combinations that I haven't tested.

I hear the TT4 is finally coming out soon. It'll be interesting to see how it compares. And I think that probably means it's time to finish the new scripting engine on the T2 and get that published. =]

From: Gordon Arnold
Topic: 4781 Message: 4796

I had an APRS interference problem with the broadcast radio when the 2-way antenna was on the trunk lid, even as far across the vehicle from the broadcast antenna as possible. I mitigated it by moving the 2M antenna to the roof, only 20" or so above the plane of the trunk.

4797. Maybe I am way off track here can yo clarify for me please

Yahoo group: APRS (2007 — 2010)
Date: 2008-01-04 21:28:01 UTC
From: Ray Shadow
Topic: 4797 Message: 4797

Ok here is what I am trying to do. I am trying to work with a SAR team to plot search positions. The Teams each use a vx-150 radio's tied to a ETRAX (I think) GPS through a device of some type. I have not cracked the case yet to find out exactly what it is but it has to be something like a tinytrax from my understanding. For the command trailer they have a ft-8900 from Yeasu (http://www.universal-radio.com/catalog/fm_txvrs/0890spec.html). This radio has a TNC connector on the back.

Now for the question how does the ft-8900 communicate with the computer and the software? In this case it needs to work with topomaps 6.0 from Delorme.

This has worked in the past with a different version of maps but that
was before my time and was set up by someone much smarter than me.

Thanks for your time and assistance
Ray

TinyTrak TNC from Byonics. Another likely possibility would be an
OpenTracker TNC from Argent Data Systems.

You will need:

*) A radio modem (TNC or Terminal Node Controller) connected to the
TNC connector on the radio.
*) A source for power for the TNC.
*) A serial cable or USB->Serial cable going from the computer to
the TNC.
*) A Windows APRS program that can use Delorme Topomaps. I don't
know if one exists. Here's what I do know:

http://www.eskimo.com/~archer/aprs_capabilities.html
and
http://wiki.ampr2.net/nwaprs/SearchAndRescue

Good luck and let us know how you make out. If you come up with
additions for the chart, let me know that too.

Scott,
I found this off the APRSPoint website:

11. What should be my tnc settings?
Your tnc should be set to terminal mode, 8 data bits, 1 stop bit and no parity. Most tnc's are set up that way by default. You NEED to set MSTAMP, HEADERLN and MCOM(not MCON!) to off. Recommended baud rate is 9600. If you change the baud rate of your tnc, make sure you choose the same rate in aprspoint connect dialog.

So will the OT1+ support this mode?

Thanks

Peter Dakota Summerhawk

The OT1+ does have receive capability. It's software-based as opposed to the T2's hardware-based (2211) demodulator. It works remarkably well

for such a low-power DSP platform (8 bit CPU, ~2-3 MIPS) and some people

even use it on IGates.

In tracker mode it uses the RX capability to generate NMEA waypoints for

incoming stations. It can be used as a generic KISS TNC if you load up a different firmware image. That process takes about 20 seconds and doesn't require any configuration.

> use the TNC's for things other than APRS. Be careful about buffer
> sizes though as that may limit their use in some cases (for instance
> long TCP/IP packets).

Yes, none of the OT1+/T2 units are suitable for large packets or lots of

outgoing packets in quick succession (i.e., in the same transmission). The T2s have plenty of buffer to handle incoming APRS packets for digipeating and should keep up with any physically achievable network load. The OT1+ buffers exactly one packet at a time, so it's a little more limited. In practice, it's perfectly capable of keeping up with an

almost constantly busy channel thanks to the fact that incoming data is at 1200 baud (with a lot of overhead) and outgoing is at 4800 baud.

The GPS2 is the same as the Deluo Universal Pro. I forget who manufactures it - Polstar makes the GPS1 (aka Deluo Universal WAAS). I carry it with the Deluo branding, and it works great. Low power consumption (maybe 55 mA) and good sensitivity.

I've got a large batch of similar units on the way from Taiwan myself. They're about the same internals (SiRF Star III chipset) and have the same sensitivity, but I think the waterproofing is better and the LED is easier to see. They're slightly larger. I expect to be able to beat both the Byonics and Deluo prices by at least a few bucks. If all goes well they'll be here in 3 weeks or so.

All of the commands listed above are for a TAPR-2 or perhaps a
Kantronics-style command set. The OT1+ doesn't have anything like
that. It's not a generic TNC.

The OT1+ can be used in KISS mode with a different firmware load.
Does APRSPoint support KISS TNC's?

OK hope all had a Merry Christmas and a Happy 2008 so far. My question to the group is this - I have 2 KPC 3s one made in 1996 and the other 1992. I have been using the one made in 96 since just before Christmas and it has been working just fine up until about three days ago. Then it stopped. I use Hyper Terminal to program it. The problem is when I load hyper terminal to see why the TNC is not working it well not read it. The only way I can start reading the TNC is to do a hard reset, then it will start working again. I have to reload all my information in the TNC for it to work. But then after about 2 hours its right back to not Trasmiting. I put the older TNC on the radio did the same thing as the newer one. It is almost like it getting some feed bsck into it and screwing up the program. Anyone have any ideas how to check this or maybe you might know just what is wrong with the whole thing.

Well, I have been working on the problem all afternoon. This is what I have found. Once I have the TNC programed and it is up and running As long as I do not trun it off and then back on it seems to work properly. Now if I turn the TNC off then back on the program gets screwed up. the funny thing about this is it will only screw up after I have had it hooked up to the radio, it well even miss up if I unhook the radio then trun it off and back on. As long as I do not hook up the radio to the TNC I can turn it off and on all I want and it will work fine. But then like I said hook it up and trun it off and bam it is screwed. Anybody have any thoughts as to why this is happening. kd5jjp

No, there's no terminal mode on the OT1+. It'll do KISS, which most
modern APRS programs support, but there's no terminal. The Tracker2 has
one, but KISS is still a better option.

This is a funny situation and the reason I asked the question in the first place. SCS-PTC seems to have everybody running scared from developing software to run Pactor III. I suspect that it is not covered by any sort of patent except maybe for some equipment design patents. I found the same document (expiration due to failure to pay maintenance fees). This was the only US patent regarding Pactor that I found. Of course patents are so confusing in their descriptions that it is hard to discern what they really do cover. I suspect that the hardware may be covered by a design patent; I haven't really researched that. Of course, they don't have to release the source for any code they have but it appears that they can't stop anyone else from developing software to use the protocol. But, then, you might not be able to sell it in Germany!

Another funny thing: SCS-PTC claim to have invented Pactor and hold all the patent rights; they MIGHT hold those rights in Germany. The principles of SCS-PTC aren't even mentioned in the US patent and the patent was not assigned to SCS-PTC; it was assigned to Pinoak Digital Corporation. Of course, it could have been sold. Things just looked funky here and I was trying to get things straight in my mind.

Thank, guys, for all your help.

For those who might be interested in patent terms, etc., I found the
following link that summarizes the US Patent system. Interesting that
in my answer before, I referred to a design patent. It turns out that
a design patent only concerns how something appears. What we're
dealing with here is a utility patent. Also the patent term has been
extended to 20 years instead of 17 years and it is non-renewable. It
can be extended under certain circumstances.

Anyway, interesting reading:

Not to disagree, since I'm not a patent attorney I don't know the terms. I do remember some years ago that there was a big hubbub when SONY did not renew their patent on Trinitron after 17 years, apparently it was an option and other makers promptly brought out clones. (If you remember 1980, Trinitron was a huge step up from everything else.)

From http://wiki.answers.com/Q/How_long_does_a_patent_last:
"For example, a utility patent filed in the USA in 1994 and issued in 1999 would have a statutory term of 17 years from date of issue (later than 20 years from date of filing, which was prior to 1995), but will expire on its 4th (or 8th or 12th) anniversary if the necessary maintenance fees and late charges are not filed, and may be invalidated earlier (in whole or in part) by various judicial findings, or may be extended by USPTO adjustments to compensate for delays in FDA approvals. "

But if a payment really was missed, and that really makes the patent expire with no forgiveness...someone ought to jump on that. Maybe MFJ can get the clones built in China for $99.95.<G>

No, $99.95 would be the sale price - wouldn't cost more than $30 to get
built in China. =]

Still, compared to some products, electronics don't seem that bad - ever
looked at Crocs? Those stupid injection-molded foam shoes? They look
to be molded in two pieces and have two rivets to hold the strap on.
That's it. They sell for over $20 on sale. I don't think they can
possibly cost over $1 to make - I can get fairly complicated cable
assemblies made for $1 if I want to order a couple thousand.

On a related note, if anyone can recommend a good domestic sheet metal
fabrication shop that can produce the OT2m enclosures (20 gauge steel,
powder coat, integrated PEM fasteners) for me, let me know! Ten-Tec is
a great company to work with, but they're not cheap. I got a quote from
a place in China that's less than 1/2 what I'm paying now, but I'd be
happy if I could get a more modest cost reduction and keep production
domestic.

I bought APRSPoint and it dosent support kiss mode for some reason. A real dissapointment in the software. Now I have to hunt down a tnc that will work with the software. I was thinking about winaprs due to that will work in kiss mode but I don't like the tiger maps and have some of the old winaprs maps that might work with it if need be. I am only looking at tracking for the one county I live in and don't need the whole us map.

No, there's no terminal mode on the OT1+. It'll do KISS, which most
modern APRS programs support, but there's no terminal. The Tracker2 has
one, but KISS is still a better option.

That's good to know, as I was thinking about APRSPoint after going through
the trouble of finding/buying an old copy of SA only to find out it won't
work with APRS+SA because it's the "deluxe" version. But if APRSPoint
won't work with AGW, it's off my list. Thanks.

well, not those consumer units which are meant to be used in pleasure
boats. Then have NMEA in order to communicate with other boat
equipment, like VHF radio (do provide the position for
emergency/distress signals), chart plotters, auto pilots, and so on.

Ask before you buy of course. The list isn't guaranteed to be
correct, but it's a good starting point.

Let people know if you come up with corrections for the lists. It's
a Wiki, so it's all user-contributed web-page updates.

By the way, the term hasn't really been "extended to 20 years".
Instead it has been changed to 20 years from THE FILING DATE of the
application instead of 17 years from the issue date of the
patent....the extended under certain circumstances basically boils
down to it can be extended if the patent office takes longer than it
is supposed to and the applicant behaved perfectly during the
application process then the term will be extended to compensate for a
bit of the delay due to the PTO.

4827. Roll your own APO

Yahoo group: APRS (2007 — 2010)
Date: 2008-01-08 03:10:23 UTC
From: scottbomb
Topic: 4827 Message: 4827

I recently bought a TinyTrak3+ for my first APRS setup. When I bought the device, I considered also purchasing the APO3 to control the power to the setup. However, after realizing that it's basically a voltage-controlled switch I wondered, "how hard would that be to build?"

So I set out to build my own. I googled voltage comparator and 555 timer circuits and came up with two circuits that work well together. I also learned a lot in the process. I breadboarded, tested, and built this circuit and it's now in use in my car. It automatically turns on and off my APRS setup when I start and shut off the car without running any wires to the ignition system. It also has built-in delays.

I use an op-amp as a voltage comparator that detects the increase in voltage when the car is started. One this happens, power goes to a 555 timer which begins a 5 sec. countdown. At then end of this countdown, a relay is engaged (radio shack relay that is rated 10a at 12v). This relay connects a 12 ga. wire to another 12 ga. wire that powers everything. When the car is shut off and the battery voltage goes down, the comparator cuts off the 555 which cuts off the relay. Power off time takes about 10-15 min.

The schematic is posted in the Files section of this forum under "Roll your own APO switch". All values are in ohms and microfarads. The LED is optional but I think it will help in calibrating the device to your car's electrical system.

First, calibrate at the bench. Using the 5k VR on the regulator, set the output to as close as 6v as possible. Then, using the 5k VR on the non-inverting input (+) on the op-amp, adjust until the voltage on that op-amp pin in enough to turn on the timer. The LED should light immediately and after 5 seconds or so, the relay will engage, supplying power to whatever you want (radio, GPS, TinyTrak or TNC, etc.) Make sure this relay will handle the current you are using in your circuit! I'm using an HTX-202, TinyTrak3+, GPS2, and 35w 2m amplifier. A 10 amp relay is sufficient for this setup but you may need a larger one depending on everything you're powering. I also have a small switch to turn power on to the APO that goes just before the voltage regulator.

When you connect it between the car's electrical system and your equipment, everything should power on after about 5 seconds. DO THIS WITH THE ENGINE RUNNING WITH LIGHTS AND A/C ON (this is critical). If it doesn't come on, adjust the VR on the op-amp until the LED lights. If not using the LED, turn the VR every so slightly, wait 5-

7 seconds and listen for the relay; if it doesn't come on, adjust and wait again. As an alternative, you can also use a DMM to check for voltage between the op-amp and 555 timer. Voltage should appear on 555 pin 8 when the threshold is met. As you can see, this is why the LED helps here. I didn't use an LED in my circuit, it was an afterthought. I did it the hard way and it took a while to calibrate.

Then, turn off the engine. Everything should still be on. WAIT about 10-15 min. for your car's battery voltage to slowly go down to about 12-12.5 v. Turn the VR every so slightly just until the device cuts off power.

It's very important that the engine off after 10-15 min. voltage is at least 1/2 volt to 1 volt less than the voltage with car on and everything that eats current running (A/C, lights, 400 watt stereo amp., etc...). This way, the device will stay on while you're driving and shut off after the engine's been shut off for 10-15 min.

It works great and if you've got some building experience, it should be a piece of cake and it will cost you less than $20 to build with all the parts easily available at your local Radio Shack.

4831. Meteor Scatter Emcomm Email Project Using 6m & APRS

Yahoo group: APRS (2007 — 2010)

APRS Meteor Scatter Email System
Bob Bruninga, WB4APR, US Naval Academy Satellite Lab, Annapolis, MD

The self plotting of APRS packets and global connectivity of the APRS-Internet System (APRS-IS) makes it ideal for an Emergency Meteor Scatter Email System. . The mission objective is to be able to get Email out of a large scale disaster area (such as Katrina). . Using 100W 6 Meter radios and standard AX.25 packet, it should be possible to send outgoing APRS short text-message Emails reliably. .

There are several key factors making this possible.
Meteor Scatter is long term reliable for a few words per minute average throughput
Meteor Scatter ranges provide good coverage between 500 to 1000 miles
6 Meters is an ideal HAM band for Meteor Scatter
Surplus 100 watt 6m radios are readily available and innexpensive
APRS Internet connected Gateways are found everywhere all over the USA
Adding a 6m receiver at many IGates would immediately provide the Email-Receive capability
MS paths are very spot specific, so multiple receivers greatly increases receipt probabilities
The Automatic Email delivery system (WU2Z) is built-in to the APRS system and reliable

The APRS Meteor Scatter web page has been updated to add the new
EmComm Email concept using 6m Meteor Scatter.

http://www.ew.usna.edu/~bruninga/meteors.html

We simply add RX's to each APRS Igate, and the rest of the
infrastructure exists. We get not just point A->B MS
reliability, but point A=>BBBBBBBBBBBBBBBBBBB potential
reliability. Meteor paths are very spot to spot specific, but
if we multiply the receive sites by dozens, then we improve the
throughput potential by dozens. Done.

Using surplus 6m 100W ratios all we need is fixed gain antennas.
And using just 120 feet of a piece of long wire can give 12 dBi
gain in a given direction. Perfect for this application. So
dust off that old 6m clunker, connect it to an Igate and lets
see what comes in.

Notice that since anything received by ANY IGate is not only
tagged by that IGate but also shared live to the entire APRS
network, we have a built-in performance monitoring system too.

The entire infrastructure exists. It's plug-n-play...

Bob, WB4APR

From: KB1LCS
Topic: 4829 Message: 4834

Awesome question! The FTM-10 does have a microphone available as an accessory. The mic plugs in the back of the radio using a waterproof connection. Find the pinout and wire the other end to whatever TNC you like. You'd wire the GPSV to the Tracker by following the directions. Power the GPSV using a 12V receptacle. If it were me, I'd use a Deluo GPS receiver so the tracker will power it (5V), nothing spectacular.

Whatcha think?

4835. Proximity Alarm?

Yahoo group: APRS (2007 — 2010)
Date: 2008-01-10 20:05:55 UTC
From: Tim Smith
Topic: 4835 Message: 4835

Does anyone know of any applications that has a proximity alarm? I'd like to be able to detect any mobile APRS stations within a certain coverage area. I know that UI-View has a movement alarm that can ring a bell if a station moves (that has been put into the database ahead of time). But that works regardless of where the mobile user is (1 mile away or 100 miles away).

Main reason is to greet mobile users as they enter the area...among other uses.

Thanks,

Tim, N1TI

Xastir has this, but it also alarms on stationary objects if they're
inside the circle, which gets annoying real fast. We need to have
it check whether the station has changed position recently and skip
the alarm if not. It can alarm with a sound or with the
text-to-speech software "Festival".

From: Scott Miller
Topic: 4835 Message: 4838

I was actually working on doing this within the Tracker2's scripting language. Not sure it'll make it in there, but sending a message to a user entering an area was exactly the sort of application I had in mind. The biggest problem with the T2 is the lack of RAM to keep track of who's gotten a message already so you don't hit them over and over. The proximity trigger might still be useful for other things - turning on your driveway lights when you get within a mile, for example.

You might check aprsworld.net. Jim had some alert features I think, and I know his database has some spatial capabilities. I've worked with Oracle Spatial and a custom APRS parser, and it'd be fairly easy to write a query that says 'return all stations in area xyz that weren't in area xyz in their previous packet'. You can also do cool things like finding all stations within 500 yards of Interstate 40 doing more than 50 mph if you want to identify users on the highway.

So there are some possible solutions, but I don't know of anything that'll do what you want now, without any programming.

Thanks Dick...

Meanwhile I found what I think is an acceptable solution in UI-View.
I played around with the exclusion list and filters. I was able to
filter everything except moving objects (by symbol) and enable cars,
jeeps, vans, etc. Shrinking the coverage filter down to a few miles
and enabling sound announcements seem to be working.

Thanks,

Tim

4840. How can I use APRS with my Yaesu FT8900 and a TOM TOM Nav

Topic: 4840 Message: 4840

Ok I looked around the internet. I cant get a straight answer. Can I wire up my Ft8900 with a tom tom one xl nav. Friends in the pass told me all I need was a nav and the radio. They were not specific. So since I read my QST this morning on APRS and Christmas was good to me this year I figure Ill try to wire this thing up and give it some play. If I like it I will try to put up some repeaters for it on one two of my sites. Can anyone help. Thanks 73

Hi Tim,

PA7RHM has a Vicinity Alarm add-on for UI-View 32. I haven't
used it myself, but it sounds like it might do what you want.
<http://home.planet.nl/~chrisvangorp/>
Click on downloads and then click on the link for online help
for Vicinity Alarm for information on what it does.

Well, I'm a little slow on the reply, but my unit finally showed up via usps (5 days later, after paying for 2-day) and I'll be making an adapter for the D700 tomorrow.

The size of these things is incredible, especially when compared to units of only 10 years ago.

Thanks for the review,

Eric

4843. Roll your own APO - part 2

Yahoo group: APRS (2007 — 2010)
Date: 2008-01-13 05:40:41 UTC
From: scottbomb
Topic: 4843 Message: 4843

Rod, N8QVR, has brought to my attention a problem with the LED in the circuit. The coil on the relay is rated at 9 volts and the LED is dropping the voltage to about 7 - not enough to engage.

As I mentioned in the original article, the LED was an afterthought and the associated voltage drop did not occur to me as it was not a part of the original circuit. However after reading Rod's email and experimenting with adding the LED tonight, I can see that it will indeed cause a problem.

Therefore, I will be deleting the schematic in the files section tonight and I will re-post it tomorrow after I add a transisor to the circuit to fix this problem.

Other then the LED bug, this circuit is working like a charm. Stayed tuned as tomorrow I will re-post the schematic with the corrections.

Hi Paul,

I have used, with great success the Kenwood TH-D7 HT. It is the only one that I know of that is factory ready for APRS. I just plug it into my AvMap G4T and away I go.

73,
Rex

The kenwood D7 has the APRS TNC built right in

http://www.universal-radio.com/catalog/ht/4211.html

The AVMAP GPS will provide your GPS coordinates to the kenwood for
transmission and it will also display other hams on the map when their
APRS packets are received by the kenwood.

http://www.universal-radio.com/catalog/ht/50634211.html

Its ready to go right out of the box

Paul,

I use a Kenwood TH-D7G(2). It has a built in TNC, just connect a GPS that has an NMEA serial output and you are ready
to go. I use mine on my bicycle with a Garmin GPSMap 60CSx.

That's a lot of endorsements for the D7. I've got one myself, but I have a few complains... mostly that it's very pricey (> $300), uncomfortable (the battery pack sticks out too far), and has a rather pathetic battery life.

It *is* currently the only handheld with an APRS display and built-in messaging.

If you just want a tracker - and the ability to see waypoints like the D7 + AvMap combo - you can get a junker HTX-202 or similar from eBay for $50 and a $32 OpenTracker kit (my product, shameless plug). The Tracker2 does a MUCH better job of waypoint output than the Kenwoods if you've got a good Garmin or Magellan GPS receiver. You don't just get pushpins, you get appropriate symbols, plus comment text, altitude, and so forth. The Tracker2's not quite so portable, though.

I think any low-power op-amp should work but I'm using the NTE-928M. It's a dual op-amp so I'm just using one side of it.

There were a couple of errors in the orig. schematic I posted so I drew a new one this morning and I'll be posting it later today. Basically the only changes are:

1. Op-amp supply voltage Vcc comes from the battery/power in, not the regulator.

2. When using an LED, I've changed the circuit to use a transistor to switch on the LED. This solves the problem where the LED was dropping the voltage too much.

Also, the relay coil should be rated at 9v. A 12v coil relay *might* work - I haven't tested it. The relay I'm using is Radio Shack 275-005 which can be seen at http://www.radioshack.com/product/index.jsp?productId=2049716&cp

Hi,

well i have here a GPS,TrimbleNavigation ,it is yellow and black.

i looking for a way to RESET it ,like an HArd Reset with a tnc.

i dont find much info about it on the web .

i dont see any jack or plug where i could connect an Tiny or Tnc too.

it looks like it could be used on maritime use since it is well built
and sealed.

thanks and best 2008 all

gervais ve2ckn

I have trackers and use TK-260G for all of them. I use the software and cable to program them and they stand up to being I the trunk of the cars really well and I have found several on eBay for around $40 or so. Just depends on how much money you want to spend.

Everyone is recommending the D7 but beware that the battery doesn't last long with the TNC running for APRS. Even the Hi-Cap battery is not all the great. What I run is a Tiny Trak hooked to a TK-260G and GPS and they run for a good long time.

The battery life on the D7, especially with the standard battery, is AWFUL. I find it's only good for a few hours of serious APRS use.

I'm getting really spoiled with my little $90 PX-777 and its standard 1200 mAh Li-ion battery. Haven't even needed to switch to the 1600 mAh battery. And it's WAY lighter than the D7. I'm afraid the charging requirements probably preclude ever having a Li-ion battery for the D7. Would be nice, though.

One of these days I'll have to figure out a way to cram a tracker inside this thing. Might be able to fit it between the main board and the keypad, but it'd take some creative wiring.

Scott,
Is the PX-777 antenna removable? Do you think it is possible to use a 1/4 wave car roof mount antenna for it? Would that improve usability of it on APRS use? I go up and down I95 on the east coast from Baltimore, MD and Tampa, Fl regularly. Is PX-777 good enough for that purpose? Or should I invest in a mobile unit? Icom IC-2200H / Alinco DR-135T ?

4858. Roll your own APO - part 2 cont'd

Yahoo group: APRS (2007 — 2010)
Date: 2008-01-14 03:52:31 UTC
From: scottbomb
Topic: 4858 Message: 4858

I've uploaded the new schematic to the files section. This one corrects a few errors from the prevs. schematic:

1. The diode is now transistor-switched to prevent it from dropping the voltage to a level where the relay won't engage. I'm currently using a 470-ohm resistor on the LED however I'm thinking about increasing this value.

2. The op-amp Vcc comes from the main power (car battery) as opposed to the voltage regulator. The only purpose of the regulator is to provide a 6v reference to the op-amp.

3. Clarification has been made as to the relay type used.

I think this fixes the reported problems from the prevs. schematic. If you have any problems with this circuit, please let me know.

Scott, n0xmz

It's removable. SMA connector, but the polarity is opposite what I've seen on most ham rigs - the antenna is female. I'm planning to get some suitable BNC adapters, but I haven't gotten around to it yet.

5 watts is still a little weak for a mobile tracker, at least in some places. I don't know about I-95. If you're going to go with a new mobile rig to dedicate to APRS, my recommendation would be the DR-135T. It's easy to hook up to an external tracker, but (shameless plug time) with my internal Tracker2 board it's about as integrated and full-featured an APRS rig as you're going to get, short of a D700/D710. And with a Garmin GPSmap 276C or something similar, it beats the D710+AvMap for mapping. Of course, the 276C will probably cost you more than the radio and tracker combined.

I've been experimenting with some little 5-watt transceiver modules, and I think I'm going to have to pick up an amp like the Mirage B-34 - that'd give it 35 watts out for about a hundred bucks. Which puts it right back into the price range of a 50-watt mobile rig, but at least there's some flexibility there.

I'm going to have to put together a demo video or something for the Tracker2 with Garmin waypoint output. Everyone makes a big fuss over the AvMap and how it shows (I think) TWO different symbols for APRS stations, moving vs. stationary. The T2 does dozens of symbols (depending on the GPS receiver) and has comment text and altitude - makes it WAY more useful, but I don't think I've really done a good job of showing how it works.

I hear the TinyTrak4 is due out soon, also with waypoint output capability. It'll be interesting to see how it compares - I really don't know what Byon has planned for features.

Oh, I forgot to mention that the one thing I don't like about the PX-777 for tracker use is that it doesn't have a convenient DC power jack. The drop-in charger will take 12 volts, but it's not exactly ideal for mobile installations. I've got some car adapters on the way that I'm going to try out - they clip on in place of the battery and have an in-line regulator.

The clip on battery replacement would be a great accessory. I don't know how big the battery component is but maybe add another version that incorporate the OT+ SMT with pinout/jack for a pigtail for gps, mic, and spk.

Looking at the back of the radio, there are only three connections, so getting any other signals out would take some work.

I still want to do a tracker+GPS in a speaker mic, but that's going to have to wait.

Subject: Re: [APRS] Re: What HT to use for APRS

The battery life on the D7, especially with the standard battery, is AWFUL. I find it's only good for a few hours of serious APRS use.

I'm getting really spoiled with my little $90 PX-777 and its standard 1200 mAh Li-ion battery. Haven't even needed to switch to the 1600 mAh battery. And it's WAY lighter than the D7. I'm afraid the charging requirements probably preclude ever having a Li-ion battery for the D7. Would be nice, though.

One of these days I'll have to figure out a way to cram a tracker inside this thing. Might be able to fit it between the main board and the keypad, but it'd take some creative wiring.

Hi Paul,

For absolute easy implementation, the TH-D7 is the way to go. But, if you like at least some project quality, and saving money, not necesssarily in that order, there are so many other options, Scott's being a nice one.

In using the Kenwood radio, you will find it does not do SmartBeaconing. In my opinion, that is a really useful feature. Several trackers allow for this method of beacon control. Google this feature when you get a chance.

Hi Scott,

I have the battery eliminators from Batteries America for my HTs. I have a complaint about them, the DC-DC convertor is in the 12 volts plug. There is a lot of room for it in the empty battery housing. I actually plan to move it into the housing since I plan to cut the 12 plug off and use something else for a connection. I am curious if the trackers can sit in closely to the DC-DC convertor. A metal box around them might be useful.

Best regards,
Fred

Another nice feature available on the Tracker2 is the ability to do digipeating and/or pre-emptive digipeating. It'll do tracking, post waypoints to your Garmin or Magellan GPS, and do digipeating all without changing the configuration. The pre-emptive digipeating is nice for events and for SAR missions, where you might have trackers strung out a ways from the ICP, but other trackers in-between: The in-between trackers can digipeat the outliers back to base. See item #13 here:

This circuit has indeed been a learning process. Alex, kf4lvz, has offered some great advice on this circuit. I will test these and update the schematic tonight to reflect the changes.

Disclaimer - I'm not engineer, just an amatuer, so build at your own risk :o)

First, you may want to rewire the adjustment pot so that the wiper connects to the op-amp. That way it'simpossible to accidentally short circuit the system by winding the pot all the way to the bottom. You'llstill get your voltage divider, but safer. As it is,if I go too far down to the bottom, your 12 volt line will suddenly be kissing your ground and sparks andmagic blue smoke shall fly. :)

Second, the LM317T typically requires about 3.5 mA of load current to maintain stable regulation. The op-amp isn't going to provide that kind of load in this configuration so your LM317 could start drifting around without anyone realizing it. You could put a load resistor on the end of it to ensure it has minimal load current without changing anything else in the circuit or: If you replace the entire regulator and all those resistors and capacitors with a single 20 kohm resistor and a 5.1 volt or 12 volt Zener diode, you'll have a very stable voltage reference and only two components are required. The maximum current drawn by a Zener regulator with 20 kohm resistor would be about 0.6 mA.Radio Shack stocks both 5.1 and 12 volt Zeners.

Currently tracking a balloon carrying APRS over Canada launched
earlier today from a school near Terra Haute Indiana.
Current position reported:
http://www.findu.com/cgi-bin/find.cgi?call=W9YJ-11

For a complete track, and to follow progress, see
http://aprs.fi/ and log in, then track W9YJ-11 over last 6 hours.

For launch information, see
http://www.ARHAB.org
AMATEUR RADIO HIGH ALTITUDE BALLOONING LAUNCH ANNOUNCEMENTS
Update #617 : Wednesday 16Jan08 14:00UT
BASE-20

Logged this flight on my APRS terminal from NC IL while near Toledo, OH.

Enjoy

4871. RTrak Now Available for Order

Yahoo group: APRS (2007 — 2010)
Date: 2008-01-18 02:13:30 UTC
From: Jason Rausch
Topic: 4871 Message: 4871

RPC Electronics is happy to announce that we are taking pre-orders for our brand new RTrak All-In-One

APRS tracker.

The RTrak is the first true all in one APRS tracking device consisting of an internal GPS, 2M(VHF) transmitter and APRS capable modem. The entire package is built into a tough aluminum housing 123x78x27 mm (LxWxH) in size and weighing a total of 206g or 7.25oz. The connector end has a professionally milled end panel with engraved labeling that should prove to hold up to the harshest abuse.

The RTrak was designed around three important elements:

1. OpenTracker APRS tracker - Scott Miller N1VG has created a remarkable APRS tracker fitting in the footprint of a standard 28 pin DIP package. This micro version includes all of the functions of it's larger, through-hole brother, minus the on-board temperature sensor. Other included features are: SmartBeaconing, Static Beacon Rates, Source Voltage through on-board ADC (reportable in the comment field), A whole host of profile switching options, Timeslotting and many more.

2. SRB MX-146 2m Transmitter - A brand new company called Small RF Budget has come out with a tiny, wonderful 2m transmitter module that is bound to catch on fast. This little module measures roughly 1x2 inches and provides 500mW of power. The transmitter is programmable through an I2C bus for frequency programming and control. The ability to change frequency "On the fly" enables the RTrak to beacon on dual frequencies, at dual rates. This is very useful for trackers that need to beacon more often than acceptable on the APRS network. The RTrak can be setup to transmit at a normal rate on the main frequency and more frequently on an alternate frequency.

3. Trimble Copernicus GPS - This is the latest in micro "stamp sized" GPS chipsets from Trimble Navigation. This GPS is Sirf based and WILL work at

high altitudes. It has a fast cold start time of roughly 30 seconds from the time of power up.

The RTrak has two high quality, gold plated SMA connectors for the GPS and 2m radio antennas. We include everything that you need to get started. You only have to supply the 2m antenna of your choice. We suggest a 5/8 type of whip antenna for mobile operation. Supply power can be anywhere between 10-35VDC.

Here is what you get in the RTrak package:

RTrak APRS Tracker
Micro Magnetic GPS Patch Antenna
Programming Cable
Lighter Plug Power Cord
Paper Manual

Package Price: $250 + Shipping

Since this is a first run, we will be selling the first batch on a pre-order basis. When you order, your name and quantity ordered will be placed on our "Pending Orders" page. As we receive, fill and ship orders, we will update the page with the status. At any given time, you will be able to see what the status of your order is. Please allow at least six weeks for delivery. We will do our best to ship sooner.

If you would like to order, please visit the RTrak order page at:

http://www.rpc-electronics.com/trackers.php

We do accept all major credit cards and PayPal.

Please feel free to email us with questions.

Thank You!

We used to use the amateur radio diamond, but as it was replaced by a
plain diamond some symbol revisions ago, we changed to the Eyeball.

4875. Ok so the elcom TNC UTNT3 will work with APRSPoint

Yahoo group: APRS (2007 — 2010)
Date: 2008-01-21 03:33:48 UTC
From: Peter Dakota Summerhawk
Topic: 4875 Message: 4875

Well I got some help with the APRSPoint and the TNC that I bought from elcom and got it working. The program will support the UTNT3 TNC in the program although you have to tweak the TNC file and adjust the GPS settings a bit and now it works!
I will post the TNC file to the group and put the instructions in it as well if anyone wants it.

Let me know

4876. APRS website wish list

Yahoo group: APRS (2007 — 2010)
Date: 2008-01-22 22:56:33 UTC
From: scottbomb
Topic: 4876 Message: 4876

I've been using APRS for a few weeks now and so far I have found only 2 sites that do a very good job at mapping locations. However, if I knew how, I'd create a better one taking the best of both worlds.

findu.com

Pros: It provides a Google map with the option to overlay a satellite image. This is an awesome feature, especially if Google has a close-up of the location. Easy access to raw APRS data. Links to other useful stuff like Nearby APRS activity, QRZ lookup, etc.

Cons: No where on the main page can a user just type in a callsign for it to look for. To get around this, we create our own URL to send to friends or relatives so they can find us.

aprsworld.net

Pros: The box is there! Just type in the callsign and go. However, if someone's using an SSID, you better know it. I've heard that one can use a wildcard "%" but I doubt that a layman (friend/relative) will realize this is even needed. My favorite feature is that you can make a track of the recent locations. This can be a little troublesome for someone who isn't familiar with UTC (like a friend or relative) but other than that, it's pretty cool.

Cons: No cool satellite images to overlay. Map zoom not as flexible as Google. Cannot zoom when viewing the track results.

So here is what I'm thinking. Why not take the best of both worlds and make one site? Here's what I'm thinking: My teenage daughter who knows nothing about ham radio (keep it SIMPLE) goes to www.xxxxxx.com. She's presented with a box that asks for my callsign. She enters my callsign. She's then presented with a Google map that shows my position. There are the regular Google buttons (Map, Satellite, Hybrid).

In addition to that, she has a link to show my track - on the Google map. Make the links simple, too. Links like "Last Hour", "Last 24 Hrs.", "Last 48 Hrs.", "Last Week". Easy!

And to make it even better, the website will draw lines to connect the dots. She can then see that I drove from point A to point B to point C, etc. Heck, we can even throw in little arrows to show my direction of travel. All this info. is already in the database so there's no need to re-invent the wheel.

I wonder how much bandwidth it would take to host such a site...

Here is a site you might try:
http://www.db0anf.de/app/aprs/stations/mobile-W5EAK?date=2008
Sub your call where mine is: You see at the end "2008" You can add 2008-01, or 2008-01-22 to show you all the tracks for the month or a day.

You can also enter other call signs and follow their tracks.

Many of us use standalone APRS clients, such as UI-View, rather than rely on web-based sites. These standalone clients offer many more features. There is one web-based interface that you may find more to your liking, though:

http://aprs.fi/

I forgot one other way your family can track you, try:
http://www.findu.com/cgi-bin/track.cgi?call=w5eak°ree=0.07
Again you put your call in place of mine, also you can adjust the map scale by changing the number at the end of the string, presently it is 0.07, larger number bigger map, smaller number greater zoom.

Try APRS.fi. It's way under-promoted, but IMHO it's the best thing out there, as far as mapping support goes. FindU is clunky and doesn't even provide a callsign entry form, and Steve doesn't apparently plan to change that.

aprsworld supports more telemetry stuff than APRS.fi, but you're right, the maps are limited. That goes back to the days when FindU used Vicinity's maps. I think Jim wasn't comfortable violating the Vicinity terms of service (Steve had some rationale for how it didn't apply to him, but I won't get into that here) so he went the safe route and implemented his OWN map server, using free data.

I'm hoping APRS.fi gets some more telemetry features soon. It's way ahead of anything else I've seen in most respects. OpenAPRS.org was looking promising, but last I checked, it just wasn't working reliably, assuming you wanted to see something besides Napa, CA.

I have been thinking about the same thing, either sticking a OT1+ smt
and a OEM GPS engine in a speaker mic or at least a small package
around the same size. I have been looking for info on the ISM300F1-C2
Sirf III gps engine but have no idea if it would work w/ the OT1+
without having to build more circuitry to make it work...
www.inventeksys.com/html/ism300f1-c2.html is the url for the GPS chip,
But I am not a electrical engineer so I dont know what most of it
means so maybe Scott or someone else can come up with a answer if it
would be a workable combo with out too much engineering needed.

They do gave a gps mic but most of the time its for commercial radios
and not ham:
http://www.infinitygear.com/index.cfm?fuseaction=product.display&Product
_ID=593
http://www.gpsmic.com/
http://phonesupplements.stores.yahoo.net/prgpsspmic.html
Just a few off google for a search.

Hopw that helps.

Have you tried http://www.jfindu.net/PrefixLookup.aspx
??

Just be sure to type in the CALLSIGN in UPPERCASE else the
site acts like it's broken...

If the output is TTL, you'll have to to a little tweaking to the OT1+.

Well, that GPS chip specs says "TTL level serial port for GPS communications interface" And with that I'm going to venture a guess that to use it with the OT1+ I would need a ttl>rs232 circuit?

If its anything more in depth in to it or directly to the OT1+ I'll move the question over to that group list

Thanks,
Geoff

```
Project: XASTIR (xastir)
Package: xastir-development
Date : 2008-02-04 12:14

Project "XASTIR" ('xastir') has released the new version of package
'xastir-development'. You can download it from SourceForge.net by
following this link:
<https://sourceforge.net/project/showfiles.php?group_id=45562&release_id=569138>
or browse Release Notes and ChangeLog by visiting this link:
<https://sourceforge.net/project/shownotes.php?release_id=569138>

Homepage: <http://www.xastir.org>

This version has added some support for Google Earth and for
MySQL/PostgreSQL databases.

LSB and SuSE-RPM binary packages have been updated also.

4894. ARRL/TAPR Digital Communications Conference in Chicago Dates Announced

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-05 17:02:03 UTC
From: Mark Thompson
Topic: 4894 Message: 4894

Dates for ARRL/TAPR Digital Communications Conference in Chicago Announced (Feb 4, 2008) --

The Tucson Amateur Packet Radio Corporation (TAPR) has announced that the 2008 ARRL/TAPR Digital Communications Conference will take place September 26-28 at the Holiday Inn Hotel in Elk Grove Village, Illinois, a suburb of Chicago, near O'Hare airport.

The conference is an international forum for radio amateurs to meet, publish their work and present new ideas and techniques. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results and practical applications. Forums will feature the latest developments in Amateur Radio digital communications, as well as demonstrations of emerging digital technology.

More information is available on the ARRL/TAPR DCC Web site, http://www.tapr.org/dcc.html

The 18pin connector is the connector on the end of the power cable
that plugs into the dashboard mount. This cable replaces that one. I
have the Nuvi 660.

Ah. I've just got the Nuvi 350, with USB mini-B connectors. I've got a couple of different types on the way from Garmin now. I'm going to have to get my own made at some point, though.

No luck so far finding a 5-conductor mini-B cable to start from; that might take a little hunting.

4897. Call for Papers - ARRL and TAPR Digital Communications Conference

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-06 04:39:20 UTC
From: Mark Thompson
Topic: 4897 Message: 4897

Conferences:
ARRL and TAPR Digital Communications Conference
The 27th DCC
September 26-28, 2008 - Chicago , Illinois

Introduction
Mark your calendar and start making plans to attend the premier technical conference of the year, the 27th Annual ARRL and TAPR Digital Communications Conference to be held September 26-28, 2008, in Chicago , Illinois. The conference location is the Holiday Inn Hotel, Elk Grove Village IL
The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs to meet, publish their work, and present new ideas and techniques. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications.

Topics include, but are not limited to: Software defined radio (SDR), digital voice, digital satellite communications, Global Position System (GPS), precision timing, Automatic Position Reporting System® (APRS), short messaging (a mode of APRS), Digital Signal Processing (DSP), HF digital modes, Internet interoperability with amateur radio networks, spread spectrum, IEEE 802.11 and other Part 15 license-exempt systems adaptable for Amateur Radio, using TCP/IP networking over amateur radio, mesh and peer to peer wireless networking, emergency and Homeland Defense backup digital communications, using Linux in amateur radio, updates on AX.25 and other wireless networking protocols.

Call for Papers
Technical papers are solicited for presentation at the 27th Annual ARRL and TAPR Digital Communications Conference to be held September 26-28, 2008 in Chicago , Illinois and publication in the Conference Proceedings. Annual conference proceedings are published by the ARRL. Presentation at the conference is not required for publication. Submission of papers are due by July 31st, 2008 and should be submitted to
Maty Weinberg, ARRL
225 Main Street
Newington , CT 06111
or via the Internet to maty@...

Details on Call for Papers
Technical papers are solicited for presentation at the ARRL and TAPR Digital Communications Conference for publication in the Conference Proceedings.
Annual conference proceedings are published by the ARRL. Presentation at the conference is not required for publication.

The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs to meet, publish their work, and present new ideas and techniques. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. Topics include, but are not limited to:

Software defined radio (SDR)
Digital voice
Digital satellite communications
Global position system
Precise Timing
Automatic Position Reporting System (APRS)
Short messaging (a mode of APRS)
Digital Signal Processing (DSP)
HF digital modes
Internet interoperability with Amateur Radio networks
Spread spectrum
IEEE 802.11 and other Part 15 license-exempt systems adaptable for Amateur Radio
Using TCP/IP networking over Amateur Radio
Mesh and peer to peer wireless networking
Emergency and Homeland Defense backup digital communications in Amateur Radio
Updates on AX.25 and other wireless networking protocols
Topics that advanced the amateur radio art

Submission Guide Lines
Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. If you know of someone who is doing great things with digital communications, be sure to personally tell them about this!

See above for deadlines and where to submit your paper.

Some quick guidelines:
Papers should be on 8-1/2 X 11 inch paper with the following margins: left and right, 0.75 inch; top, 0.8 inch; and bottom, 1 inch (very important).
Structure of paper should be (see single column example below, two column should follow a similar format):
Title
Author(s) with affiliation
Abstract (200 words or less)
Key words (3-5)
Body
Reference List
Papers can be in one- or two-column format.
Use 12-point Times Roman for the main body of text; do not number pages.
Photos and drawings should have good contrast. Note: a photocopy gives a good indication of print quality.
Electronic submissions can be made in any of the following formats:
Adobe Acrobat PDF;
Microsoft Word
Reference citations and other topics not explicitly discussed in this list should follow a recognized standard format (APA, IEEE, etc).
A biographical page is to be included with the manuscript. It should contain Name, Address, Phone, and E-mail for each author as well as a short descriptive paragraph about the first author. The bio page will be used to contact authors concerning the conference and presentation schedule.
Release form:

A formal release form is not required, but indicate that the paper is being sent for use in the Proceedings of the ARRL and TAPR Digital Communications Conference. You are only giving permission for your paper to be printed in the Proceedings.

Example Single Column Page Layout
Two column would be similar in nature, but with two columns.
View Paper Example http://www.tapr.org/images/dcc.paper.large.gif

4899. First APRS Contact I think?

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-06 11:52:49 UTC
From: k2cig
Topic: 4899 Message: 4899

I just made my first contact with GO-32 using my Kenwood TH-D7AG
Hand-held. I had my Kenwood APRS setup as:

MENU 2-1; MY CALLSIGN K2CG-14 (although I am not sure if there is a
protocol for the suffix?)
MENU 2-2; GPS UNIT NMEA
MENU 2-3; WAYPOINT OFF
MENU 2-4; MY POSITION 36 29.95N, 087 21.42W
MENU 2-5; POS AMBIGU OFF
MENU 2-6; POS COMMENT In Service
MENU 2-7; POS LIMIT OFF
MENU 2-8; ICON Runner
MENU 2-9; STATUS TEXT >EM66hm/[
MENU 2-A; STATUS TX 1/1
MENU 2-B; PACKET PATH 4XTECH
MENU 2-C; DATA TX AUTO
MENU 2-D; TX INTERVIAL 1 MIN
MENU 2-E; UNPROTOCOL APRSAT
MENU 2-F; BEEP ON
MENU 2-G; DISPLAY AREA ENTIRE DISPLAY
MENU 2-H; MILE/KM MILE
MENU 2-I; TEMPERATURE F
MENU 2-J; AUTO REPLY ON
MENU 2-K; REPLY MESSAGE 5W HT, Arrow Ant, 1m rate
MENU 2-L; MESSAGE GROUP ALL,QST.CQ,KWD,*
MENU 2-M; DATA BAND A TX-Band B RX
MENU 2-N; PACKET SPEED 9600 BAUD
MENU 2-O; TIME ZONE UTC -6:00
MENU 2-P; TX DELAY 500 MS

I received the following messages from GO-32:

B1←4xtech-12 CU APRS!! USE PATH VIA 4XTECH
B2←4XTECH-12 APRS msgs and clients use 145.85 Upl
B3←4xTECH-12 D7 & D700 posits use 145.9

Since I was using 4Xtech for my path, and 145.85 for my uplink. I am
assuming that these are just standard msgs that are sent every time?
Can anyone tell me what this means?
73 K2CG

I sure would like to know how someone is using your ham callsign as a user identification.
Unless some company picked it up with the same intials

That just blows my mind and definitly not fair to you.

Hi. My call is SM7SUB.
Im new at APRS and thinking of using it on backpacking.
I dont know what the parameters in Trace and Wide stands for.
I have looked at several places, but cant find any simple explenation
of the terms. Someone was very kind and pointed me to a site where i
found a manual contaning over 100pages of the APRS protocol.
I hope i dont have to go throgh all those pages just for setting up my
uTNT. Can somone help me here?

Thanks and Best Regards. Christer de SM7SUB.

Date: 2008-02-07 06:16:42 UTC
From: Armour, Randy (ITS)
Topic: 4900 Message: 4910

I am far from an authority on this subject, but believe the messages you got from GO-32 are periodic beacon messages. I tried GO-32 earlier this evening myself with a TH-D7AG and arrow handheld antenna. I only saw some similar "status" messages with the date and time. I used 145.390 for the uplink, per the link below. I expected to see the message "My Location" flashed if G0-32 digipeated my position, but never saw it. I'll try 145.85 soon to see if the results are similar.

There are only a few "satgates" listening on the GO-32 downlink that will relay your position to the Internet. So, it will be difficult to know if your packet was digipeated. I did see a station in Oregon make it via GO-32 tonight. See http://www.findu.com/cgi-bin/pcsat.cgi. GO-32 is not listed on the page header. However, this is the place to see packets for it. You can find the 4XTECH alias in raw data at the bottom of the page.

I live in Goodlettsville, TN (EM66ph). We should be able to send an APRS message through GO-32. Since we are only a few miles from each other, we both will be in the footprint of a good pass. The downlink is very strong, so any pass should work. Let me know if you want to coordinate a specific day/time.

This link will tell you everything you need to know about APRS on GO-32.
http://eng.usna.navy.mil/~bruninga/GO32-ops.html

Subject: [APRS] First APRS contact I think?

I just made my first contact with GO-32 using my Kenwood TH-D7AG
Handheld. I had the Kenwood APRS setup as:

MENU 2-1; MY CALLSIGN K2CG-14
MENU 2-2; GPS UNIT NMEA
MENU 2-3; WAYPOINT OFF
MENU 2-4; MY POSITION 36 29.95N, 087 21.42W
MENU 2-5; POS AMBIGU OFF
MENU 2-6; POS COMMENT In Service
MENU 2-7; POS LIMIT OFF
MENU 2-8; ICON Runner
MENU 2-9; STATUS TEXT >EM66hm/[
MENU 2-A; STATUS TX 1/1
MENU 2-B; PACKET PATH 4XTECH
MENU 2-C; DATA TX AUTO
MENU 2-D; TX INTERVIAL 1 MIN

MENU 2-E; UNPROTOCOL APRSAT
MENU 2-F; BEEP ON
MENU 2-G; DISPLAY AREA ENTIRE DISPLAY
MENU 2-H; MILE/KM MILE
MENU 2-I; TEMPERATURE F
MENU 2-J; AUTO REPLY ON
MENU 2-K; REPLY MESSAGE 5W HT, Arrow Ant, 1m rate
MENU 2-L; MESSAGE GROUP ALL,QST.CQ,KWD,*
MENU 2-M; DATA BAND A TX-Band B RX
MENU 2-N; PACKET SPEED 9600 BAUD
MENU 2-O; TIME ZONE UTC -6:00
MENU 2-P; TX DELAY 500 MS

I received the following messages from GO-32:

B1□©4xtech-12 CU APRS!! USE PATH VIA 4XTECH
B2□©4XTECH-12 APRS msgs and clients use 145.85 Upl
B3□©4xTECH-12 D7 & D700 posits use 145.9

Since I received the messages I can assume that I have the path (4XTECH), uplink (145.85) and Downlink set up correctly. Can anyone tell me what this means?

Here is the part number for the Nuvi 350 cable. These can all be found on the garmin website under accessories for the particular model.

Data Cable,Mini B to Serial Pigtail
Part Number: 010-10813-00
Suggested Retail Price: $ 21.81 USD

I've got some due in a few days, but I won't be able to beat that price
by much. I will be able to ship it for under $10, though!

Speaking of the Nuvi 350 - my unit does waypoints just fine, and APRS
stations move around like you'd expect, but Garmin says this will NOT be
the case with all models, and that they didn't intend to leave in the
waypoint management protocol.

They see the value of waypoint/POI creation, though, and they should be
adding that to the specification at some point. No word on exactly
when, yet.

4914. Garmin GPS II

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-07 16:30:02 UTC
From: Mark - N8MNI
Topic: 4914 Message: 4914

Can a Garmin GPS II be used as a GPS receiver for APRS? I dont have the unit yet. But may have it soon. A friend is giving me his old GPS unit when he gets back from vacation.
I know that U-Iview allows you to use a GPS unit connected to a com port on the computer, I believe. But does the GPS II send out the correct format to be used with U-Iview?

"Christer" <sm7sub@...>, Wed, 06 Feb 2008 23:19:21 -0000:

>I dont know what the parameters in Trace and Wide stands for.
>I have looked at several places, but cant find any simple explenation
>of the terms.

Hej;
The original meaning was like the literal translation says
Trace=spor (norwegian);
Wide=utbredt (also norwegian; you might manage to translate to swedish
yourself, hi).

The newer use of those is to use a set of numbers behind TRACE or
WIDE, like WIDE2-2 meaning that the digipeater will pick up your
packet, reduce the last 2 to 1, and re-send the packet. The next
digipeater will remove the 1, and re-send it. But no digipeater will
pick it up any more.
In large parts of Europe, the digipeater setup is like in the USA, and
you can use WIDEn-N only. Most places in SM7, I think that WIDE2-2
will be good. If you're driving or walking with an APRS station, you
could use WIDE1-1,WIDE2-2 in your setup. Many home stations are setup
to digipeat on WIDE1-1 only, and weaker mobile stations will get an
extra help from those "fill-in"-digipeaters in order to reach a normal
digi. The other guys have given some examples, but they are primarily
for USA and Canada.
Because you live in SM7, close to Denmark, you should know that in
Denmark, they don't use WIDE1-1 for fill-in-stations, they use RELAY.
And they don't digipeat on WIDEn-N, they demand that you use TRACEn-N.
So for Denmark trips with your car, you should set the unproto path to
RELAY,TRACE2-2.

I have never really understood why the north americans insisted on
leaving the TRACEn-N as the traceable parameter, and reconfigure their
digis so WIDEn-N became traceable. But they did, and so it is. Also in
the USA and Canada, EI, large parts of LA, SP, some areas in SM, DL,
and the rest of Europe.

Yes.

Check whether it's a II or a II+. The II has a single receiver
which it multiplexes time-wise across eight satellites. It both
takes longer to acquire a good fix and loses lock very easily.

The II+ has 12 parallel receivers and can lock onto 12 satellites
individually, it acquires and holds on to the lock much better.

Both can be used with UI-View or other APRS apps and TNC's.

Apologies...I replied to this question without noticing the call sign is
located in Sweden. The links below will explain the mechanics of
(Relay,Trace, Wide). However, they make recommendations that may not
apply to your specific location. The concept is somewhat difficult to
understand and I fear that I may have added confusion instead of
helping.

4920. KAM on HF with Icom 706MKIIG

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-08 23:33:20 UTC
From: almetelo
Topic: 4920 Message: 4920

Hi Guys!

I work APRS on VHF FM with software UI-VIEW 21 V2.03 and I have very low experience on it but know I would like do it on HF bands mainely on 30m 10.147.6 USB using my KAM all mode and rig 706MKIIG. The settings I've made on the KAM are not working and the cable I've wired for the KAM and rig seems to be fine but no results :-(

Which settings I must to do on the KAM and rig?

You help is very appreciated.

I also have MFJ-1278 but did not try with it yet, if you have settings for this TNC for work on HF is very wellcome as well.

Thanks!

AL CT1GPQ

In UI-View's Setup - Comms setup, select host mode=KISS, and then
click the Setup button. In the Easy setup, tick "Kan". OK your way
back. Now UI-View is taking command over your KAM.
What about your settings for the rig? Well, I don't know the IC706.
Someone surely will know.

From: k2cig
Topic: 4922 Message: 4922

I tried several times this weekend to work the ISS with my D7 and an Arrow Antenna without success. It has been announced that from 9-18 Feb 2008 that an SSET (Satellite Simulated Emergency Test is being conducted and that you can try to send emails via the ISS. Has anyone tired and been successful?

Sometimes they turn off the ISS system when there is a shuttle operation in progress.

Generally they shut down the Amateur system when the shuttle docks,
and/or EVAs are going on. More than likely it was off when you were
trying.

http://www.issfanclub.com/

is a good source for the current state of the ISS system.

4925. Suggestions for a dedicated aprs vhf tx/rx?

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-12 00:47:55 UTC
From: Bob MacDonnell
Topic: 4925 Message: 4925

Hi all;
I'm new to this group, a retired Canadian who spends most of his time Down Under in Australia and Vanuatu.

I'm looking for a small, fixed frequency radio tx/rx which can be left connected to a NMEA output GPS for APRS use in North America.

Maxon (now Midland in the US?) DP2550 is available in Australia, but I have no means of programming for the North American APRS fx. Can anyone program a Maxon DP2550?

The required Maxon programmer is the SMP4000 programmer.

Alternatively can anyone suggest a stand alone VHF radio for dedicated APRS use? I'll have voice vhf aboard a vehicle, but would like to keep it 'listening' for voice and have the APRS tx/rx run automatically when the vehicle is running.

Thanks,
Bob

From: Jason Rausch
Topic: 4927 Message: 4927

We are getting ready to order all parts for the current batch of RTrak orders. If you plan to order one, please get your order in by the end of this week so that you will be counted.

For more information on the RTrak, please visit:

http://www.rpc-electronics.com/trackers.php

The price is still $250 per package. The package includes the All-In-One APRS RTrak tracker, programming cable, power cable and GPS antenna.

Please visit the site for all details. If you have any questions, please feel free to email us and ask!

Thanks!

If you want to keep expenses low, I recommend the Radio Shack HTX-202. It's always had a great reputation for performance in packet radio systems and can be had for about $50-$75 in the used market (such as eBay). Being an HT, it's also small enough to fit nicely into an APRS "box". See n0xmz.com for a pic of such a setup.

Thanks for the input guys.

I've used a TinyTrak3 with a TM-G707A. Just seems a waste

The Microtrac looks good. I had not explored the TinyTrak site for awhile. And it has a decent RF output.

The Radio Shack handheld looks good also.

I've considered getting an Rtrak but have a couple of reservations. One is the low output power and other is a lack of specs, even on the Rtrak group. I would have expected specs to be filed there!

I'm spoiled in Australia with a Troop Carrier which has a fibreglass top. A bonnet (hood) mounted antenna does great with no ground plane behind it. And I have a UHF antenna INSIDE the FRG roof which works well. In North America I'm considering getting a Sprinter platform RV which is high and metal construction. A roof mounted low power antenna (5/8L) would be a real clearance problem. And any such attention getter is more liable to invite a druggie inside to see what he can find to sell. I tend to use an external 'long wire' for HF so no one realizes there is an HF rig in the vehicle.

Jan,

I think you will be happy with a Micro-Trak 8000 FA. It is programmable, and
is capable of output power up to about 12 Watts at 13.2 volts. It has the
additional benefit of actually being manufactured...The Rtrak looks promising,
and I like his aluminum enclosure, but I have forsaken my Iconoclastic views
on QRP and gone to the ways of Watts, instead of Milliwatts!

Byon posted the photo of the newest revision of the Micro-Trak 8000 FA on
the website today, and I am confident that it will suit your purposes.

4935. Using PacComm Tiny-II as APRS Digipeater

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-18 02:32:30 UTC
From: Paulus Adisoemarta
Topic: 4935 Message: 4935

I just unearthed a PacComm Tiny-II TNC (I think this was the one that I use in 1992-1995 for the packet radio gateway in Austin, TX), and now I am thinking of using it as a stand-alone APRS digi.

The question is, would a Tiny-II be able to act as an APRS digi (WIDEn-N paradigm)? Do I need to purchase an upgraded EPROM?

Other suggestion is fine too (i.e. forget it, just use it as a KISS TNC on a laptop, etc)

73 de Paulus - N5SNN

Hi Paulus

The Tiny-II makes a fine APRS digipeater. Probably the best way to do is to replace the EPROM with a UIDIGI one. This is specifically designed for APRS and is freely available. The best place to find information and the files is on the UIDIGI Yahoo group.

I'm still offering free UIDIGI ROMs - my EPROM burner was down for a
week or two but it's up and running again.

Get on the UIDIGI list, find out how it needs to be configured, and then
generate a .bin file and send it to me with a mailing address and I'll
send a chip. Please don't send me the text configuration file -
generating the .bin file also does validation of the configuration so
you can catch errors and I don't have to guess at what you were trying
to do.

Of course, if you've got an EPROM burner, you can do it yourself, I just
offer the chips and burning as a public service to get some digis upgraded.

4938. Motorola CDM1250 on APRS

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-19 00:02:03 UTC
From: mthoeft
Topic: 4938 Message: 4938

Hello
Forgive me if this has been covered before, but, I'm attmepting to determine if a Motorola CDM1250 is a viable radio for packet, specifically APRS
I'd like to hear from you if you've managed the interface, cabling, etc., and if you like how it turned out.
I'd particularly like to hear from you if you've got it working via the accessory connector thus keeping the voice capability when needed.
Thanks in advance
Mike K2MPH

4939. RE: PCB design-basics.

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-19 18:49:25 UTC
From: Sandeep Lohia
Topic: 4939 Message: 4939

Good morning Leela. (VU3LGX).
And, Good morning, to rest of all YL's and Old men.

On 23/11/2007 you mailed in groups and wanted to know about PCB design-basics.
Sorry for be-lated reapply, as because I only came to know about that Mail yesterday as I was in the process of deleting my old mails.

I am not a master of PCB design, but what-ever I know and do it in my home I'll try to make you understand.

Making Homebrew PC B's is not at all a costly of unconventional affair, if you follow these simple techniques. Most of the homebrew haves PCB invalidity of printed Circuit board, major

problem! Normally the PCB manufacturing process involves use of expensive equipment including a large vertical camera, dark room equipment and accessories, stencil screen and

Ultra-Violet light lamps.

However, fabricating your very own single/double side PCB's will cost a only a few ohms of impedance. Follow this technique described here and the materials left could be used for

another projects.

For home brewing PCB's you require

(1) A Computer
(2) 600-1200 dp laser printer with treasing paper
(3) Photoshop or Auto-cad Software for designing & exact sz
However we can also use another software special PCB design software.(Demo versions of various PCB designing software packages are frequently included with Electronics

Magazines or you may also download from Net.
(4) Miscellaneous items such as single/double side copper- laminated board. W-D 40, toothbrush, hacksaw, marker-pen, a small bucket or mug, gloves, and not to forgot a hand

drill.

Etching is one of the major steps in the chemical processing of the subtractive of PCB designing. By this process, the final copper pattern is achieved by selective removal of all the

unwanted copper to retain the desired circuit patterns.

Several chemicals are used for etching. The most common etchants are.

1) Ferric chloride;
2) Ammonium persulphate;
3) Chromic acid;
4) Cupric chloride; and
5) Alkaline ammonia.

Ferric chloride is the oldest and perhaps the most common etchant. It is widely used in the 'printing' and 'etching' process in the PCB industry. It has high etching rate and is cheap &

easily available.
However one can also use cupric chloride. It compares well with ferric chloride, with the advantage that it does not sludge as ferric chloride, does. It is used in the production of fine

line multi-layer PCB`s
Here solder masking & Screen-printing is extended to make the process easier.
First design (or pre-designed layout) is to be printed from a lazier-printer in maximum dpi on a teasing paper (for screen printing), or (photo glossy paper if u using my process)any of

the net cafe will do it for u @ as low as Rs. 20/- (Please don't forget to mirror or flipped let + to right. Which would transfer a sharp, black print (toner transfer) onto the copper laminate.

(You can also use varo-boards to explimenete this process, but my friend high frequencies TX circuit do need a all side ground).

First, scrub the copper side of the copper-clad laminate used for the PCB board with a sponge, remove oxidation, stains, etc, so that the copper laminate surface of the PCB become

uniform and shiny.

Place and align the paper (with the toner side down) on the copper side, using an electric cloth iron heated to the maximum setting. on the back of the paper. Pressing firmly, heat the

entire pattern for at least half a minute.

Now you have to remove the paper from the PCB again. This can be done easily by putting the PCB (with paper) into hot water.
Now when the toner is transferred make necessary correction using a Sharpe or other etch-resistant black-ink marker pen.

Etch the unwanted copper from the board using the ferric chloride solution. Ferric chloride is actually a salt, not an acid. Use the powder form of it instead the lump one. Dilute the

powder in water. In which you will have to immerge the board.

Immersion etching is the semi-plast technique which requires only a tank containing etching solution into which the boards are immersed.

When etching solution is used for a much longer time, the etchant becomes weak. You can add a common chemical to ferric chloride to rejuvenate it. Hydrochloride acid may be used

but I used "muratic acid" HE He Haeeeeeee!!

Now finally it is ready, You can drill the holes, but it is always better to drill them before etching. I do surface-mount HE He Haeeeeeee!!

You can also do silver-plating; electroplating using the catalyst potassium argentocyanide and 12 volts, but that is another topic. HE He Haeeeeeee!!

You may also buy good book like 'PRINTED CIRCUIT BOARDS. Design, Fabrication, Assembly and Testing. By Dr RS Khandpur. Tata McGraw-Hill Publication. for better idea.

Very soon, I am also going to put some picture graphics of the systematic in my Home-page http://www.sandeeplohia.4t.com/index_2.html which is under construction.

If you spot something not right or errors in typing, please do not hesitate to call upon me and let me know. Should you happen to spot something that looks 'not quite right' or

something that I might have not explained in more detail...do drop me a line and I will get back with you on it.

Please do not hesitate to send me a letter. I am here to help in any way that I can...
I might have not explained in more detail...do call me on my lima-lima 9432315805
E-Mail address = sandeeplohia12@....

I will gladly help you through this... to shed more light on your quarry, Along with other knowledgeable visitors, I will get back with you on it. and more than happy to help!

I would also like to know if there is any technology which can make the PCB water-proof by means of laminating it from any latex resin or polymer?

Please reapply me if any body knows about it

.....your's friend, Sandeep Lohia (VU3SXT)

Hi all.

I have perfected the toner transfer method for PCB artwork and use it
on all my boards that I make at home.

You can see how I do it at http://www.swdxer.co.nr

Artwork is done on Eagle and typically I don't draw a schematic , I
just place parts and draw tracks manually.

Simple , extremely effective., but not a ten minute job.

Regards

gregW:-) OH2FFY

Just had a quick scan of it, looks a good primer.

Except I've not got 100% confidence in the detail accuracy. First page second para quotes "10Base2 each device connects to a single strand of coaxial cable through a vampire tap". Nope, it was 10base5 that did, 10base2 used t-pieces for the drop. How much more is wrong?

4945. ARRL's VHF Digital Handbook (Coming in early March)

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-21 21:15:04 UTC
From: Mark Thompson
Topic: 4945 Message: 4945

ARRL's VHF Digital Handbook
-- by Steve Ford, WB8IMY
Ham radio operators are using digital radio applications for fun, technical achievement, and public service. And it?s no wonder. Getting started often requires little more than a VHF radio and a computer.
Without complicated ?owners manual? jargon?ARRL?s VHF Digital Handbook presents the material through a unique how-to approach and friendly, conversational style. Readers will understand how to setup and operate their equipment and software, and make the best use of their VHF digital station.
Contents:

Packet Radio Fundamentals: All the basics including TNCs, operating commands, and networks (such as DX Packetcluster).
APRS ? The Automatic Position Reporting System: Track moving objects on maps (other stations, public service vehicles, marathon runners, etc.). Connect your own GPS receiver and transmit your location even as you?re moving!
D-STAR: Enjoy high-speed digital voice and data on the growing network of D-STAR repeaters.
High Speed Multimedia: Discover how you can set up your own wireless Amateur Radio data network by modifying over-the-counter gear such as routers and access points. It?s ham WiFi consumers can only dream about!
Digital Meteor Scatter and Moonbounce: Explore weak signal operating using the software masterpiece WSJT by Joe Taylor, K1JT.
Technical Descriptions: In-depth information about AX.25, D-STAR and APCO-25 protocols. Plus, digital applications in public service and emergency communications: Packet radio, APRS, Winlink 2000 and more!
Also available: ARRL's HF Digital Handbook
First edition, ? 2008, published by American Radio Relay League, Inc.
(ISBN: 0-87259-122-0) #1220 -- $19.95
Coming in early March!

ARRL's HF Digital Handbook
-- by Steve Ford, WB8IMY
ARRL?s HF Digital Handbook is your guide to understanding the most active HF digital communication modes in use today. There is something here for every radio operator?beginners and more advanced operators alike. And, as this technology rapidly advances, your increased understanding of digital communication techniques will make certain that you stay in the race as new modes and methods unfold.
This fourth edition book includes expanded station setup information, discussion of PSKMail and other varieties of PSK, new content on Olivia, DominoEX, HF digital voice and image modes, and Automatic Link Establishment.
Just getting started? All it takes is your sound-card-equipped computer and your HF transceiver. ARRL?s HF Digital Handbook will guide you through the rest!
Contents:
Assembling Your HF Digital Station
RTTY

PSK31
PACTOR
Winlink 2000
Clover
Hellschreiber
MFSK
G-TOR, MT-63, Throb, Olivia and DominoEX
HF Digital Contesting
HF Digital Voice and Image
Automatic Link Establishment ?and much more!
Also available: ARRL's VHF Digital Handbook
Fourth edition, ? 2007, published by American Radio Relay League, Inc.
(ISBN: 0-87259-103-4) #1034 -- $19.95

4946. Alternate Input Frequency - Hardware Config Question

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-22 21:34:15 UTC
From: yeagerre
Topic: 4946 Message: 4946

I have a high elevation wide coverage digi on 144.39. Received APRS activity at the digi site is nearly continuous, but transmit activity from the digi much less so. In other words, I have some "bandwidth" to spare, if I could just get local data into the transmit stream!

The equipment at the digi site is simple - a 2m rig tuned to 144.390 connected to a Kantronics KAM+ with the enhancement board. I believe it is software revision 8.2.

I would like to set up a alternate input frequency like 144.99, to make it easier for local stations (trackers, mobiles, etc.) to get a packet in edgewise.

I'm trying to devise the simplest (and cheapest!) way to accomplish this.

Could it be as simple as adding another 2m rig (or simply a receiver) driving a KISS-mode TNC (like TinyTrak4 running the KISS software), and feeding that data to the KAM's serial port? Or perhaps there is an even simpler solution I haven't thought of yet?

Thanks in advance for your help!

From: r gilson
Topic: 4946 Message: 4947

Posibly a second receiver with the COR & CD gated to mute the 144.390 receiver. A little hang time would help giving the alternate receiver a chance to remain on the second channel for more traffic.

Hi Everyone,
Is there such a thing as a Handheld with more than 5W output? I've thought of using a mobile unit for APRS but that would tie it to one car. A handheld would be more portable. If there isn't, is there a handheld and an amp recommendation? Thanks in advance.

I think the Icom V8 was rated for 7 Watts when using an external 12 volt
power source. If you need just a transmitter, I think you will find my
Micro-Trak 8000 FA (_http://byonics.com/microtrak/mt8000fa.php_
(http://byonics.com/microtrak/mt8000fa.php)) is capable of 12 Watts in a package size of 1
X 4.5
inches, although you would need to package it in some kind of enclosure
yourself.

I would be reluctant to place my head too near a 12 Watt handheld
radio.....Its enough to defrost a small turkey if it is continuously transmitting.

Subject: [tapr-announce] Packet Status Register (PSR) is looking for a few good writers

Packet Status Register (PSR) is looking for a few good writers, particulary ham radio operators working on the digital side of our hobby, who would like to publicize their activities.

You don’t have to be Shakespeare to contribute to PSR and you don’t have to use Microsoft Word to compose your thoughts. The PSR editorial staff can handle just about any text and graphic format, so don’t be afraid to submit whatever you have to wa1lou@... .

The deadline for the next issue of PSR, the Dayton Hamvention issue, is March 31, so write early and write often.

73,

Stan, WA1LOU
PSR Editor

5 Watts on APRS is good for Los Angeles to Arizona and Los Angeles to San Francisco since there are a number of digipeaters along the way and I am convinced some truckers have digipeaters in their rigs. Its really mandatory to have a good external antenna with low power and you'll be surprised how well it works.

You risk burning out a handheld by running more than 12volts, especially a Kenwood TH-D7. Electrical transients from the car electrical system must be filtered in the DC cable to the handheld for reliable long term life or run from batteries.

ONe more watt of power will not make a noticeable increase in signal strength, false thinking however using a brick amp easily found at HRO or on eBay is helpful. There are a few amps made especially for HTs, check Mirage and Maha, all this stuff is advertised on the web, CQ and QST. Power drive is 5 watts with anywhere from 20 to 35 output. When using the external amp with an HT, make sure to keep all wires short and filtered. You'll want to set the TNC parameter 'transmit delay' to a longer delay to allow for Transmit/Receive relay switching in the amp otherwise the tranmit data stream will be cut off and a reliable signal will not be possible. Usually allow for 150 millisecond. Also do you neighbors a favor and don't beacon every minute.

Make sure the EXTERNAL antenna is good else everything goes to waste.

Bill k6acj TT3/Icom IC-2AT/Deluo GPS in a small package.

I would have to agree with bill. I run a TK-760 @ 25W with a 1/4 wave antenna on the trunk with good results. I used a 50W setting with no better results with a 5/8 wave antenna. If you run an amp then make sure your settings are set to get the full packet out. The D7 running @ 5W is going to get really warm if you have it set for a short TX time interval. Cooling is the best option for running an HT for APRS. If you can take the battery off the radio to allow for better cooling that way the battery doesn't get cooked either. Heat kills batteries when charging or in use. And yes use a filtered power to the radio to avoid has getting in to your signal.

4954. Serial GPS data shows as noise on transmitted audio

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-24 21:48:13 UTC
From: ve7ltd
Topic: 4954 Message: 4954

I have a GPS 18LVC powered at 5V through a Opentracker+ encoder unit. What is happenening is that a 1 second, repeating, pulsing noise is being generated on my transmit signal. It is appearing on the transmitted audio. I am positive it is the GPS, as the noise is in time with the serial data from the GPS.

The weird thing is all I have to do is power the GPS, and share a common ground and the noise makes it into the radio.

What makes it more frustrating is it changes in intensity, based on the position of the GPS, the position of the antenna, the power output, etc.

These are part of "mobile kits" that are not permanently installed, and this the cabling may change route from installation to installation. I can null out the noise by moving cables from one location to another, but can never find a reliable way to reduce the effect of this noise on the radios.

The radios are ICOM F121S, with the accessory cable being used.

Can anyone suggest ways to rid these radios of this noise? It is louder than the microphone audio.

Does the noise go away if you pull the HT jumper? You might have to key
the radio manually to test it that way.

I have the Icom T2H and would not recommend it for long transmissions when running on 12V. Mine got so hot I could not touch the antenna connector after a ten minute conversation. Good for APRS with short bursts. Lot of radio to run for APRS. I would think an Icom V8 or an old 2A or 2AT would be more practical unless you have a spare T2H laying around.
Just for information.

With a high gain antenna and a good ground plane you should get very
good ERP (effective radiated power) using just a 5 watt handheld.

I work with a group of motorcyclists who work with the MS society's
MS150 bike rides, and in our setting we are 20-30 miles or more from our
repeater sites. One guy used a comet antenna and a Icom W32a effectively
for the entire ride before he bought and mounted a mobile antenna.

Our lead bike used to get good APRS signal out with just a whip on 10
watts.

Get a GOOD gain antenna (5-7 db 2meter) and see what your results are
before jacking up the power. You might be surprised

From: kc2mmi_whitelisted email
Topic: 4948 Message: 4959

Typical handhelds are only rated for a 5-10% duty cycle (TX/RX) because the only heatsink on their finals is the radio chassis, buried in the case and your palm so it can't shed heat. BUt those few where I have read the specs, will take 13.8V without problems--that's considered normal "vehicle" operating voltage. The problem is that slightly above that, around 14.8-16V, they start to slag down. So a regulated and spike protected power supply is a MUST, a simply cable to the vehicle is not good enough since most cars still have significant spikes, up to 200VDC (and 600VDC on trucks), on their power lines.

But pushing up the output power on an HT is only one way to skin a cat. Output power is only half of ERP. Using a good cable and a gain antenna, even a stacked omni (coaxial colinear, etc.) can effectively double your ERP without forcing the radio to be more powerful in any other way.

IIRC the 6W limit on handhelds is pretty much an FCC norm in the US. They don't let marine VHFs, CBs, bag phones, or anything else put out a lot or power when it is designed to be used next to your skull. Apparently the FCC won't give out Darwin Awards and the DA folks refuse to give out radio licenses--they've obviously cut a deal.<G>

4960. Re: Serial GPS data shows as noise on transmitted audio

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-25 16:31:14 UTC
From: ve7ltd
Topic: 4954 Message: 4960

The noise is there whether I key via the OpenTracker or key via the microphone. The only thing that kills the noise is removing the serial data input and output from the GPS to the tracker. I have tried moving all the jumpers, HI, no jumper, and HT.

I have tried a Tracker2 unit instead of the OpenTracker, and the noise is much less, but still audible. I think it is an issues with the RS-232 data voltage being too high, or something like that causing it to bleed over and modulate some part of the radio.

Is there any way to isolate the RS-232 data better without affecting the ability for the data to make it to the tracker? I have tried caps to ground on the data leads of various sizes, and it sometimes makes it better, sometimes makes it worse.

It is an RFI issue, because if I change the RF field around the components, the noise can be nulled (antennas, power output, etc).

Dave,

As I understand the problem, you are hearing a 1 second short duration pulse, which sounds like RF noise? My guess is that your GPS timing signal (Which is a one second pulse, with a programmable width of 20 to 980 ms) is fubaring your signal.

Go to the Garmin website, grab their programming info, and disable the timing pulse.

I can't recall any other reports of this problem with the GPS 18, but I've certainly seen it with the Deluo receivers. The HT jumper thing seems to be a separate issue with ground noise.

The first thing I'd try is a ferrite core on the cable. The Tracker2 has ferrite chips on the board, plus a metal case, so that may account for some of the difference.

I was going to suggest the capacitors on the data lines, but if you've already tried that, see if a series resistor on the data line from the GPS helps.

When I've heard this, it's not the 1PPS timing pulse, it's the NMEA data
which is also transmitted every second (or every two seconds for some
models.) It's kind of a high-pitch whine that corresponds with the data
coming out - you can even tell by ear sometimes if it has a lock or not.

4968. Standard SSID for use with APRS Mobile and Handheld

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-25 21:21:10 UTC
From: Lou Catozzi
Topic: 4968 Message: 4968

I see that most stations on APRS use an SSID with their callsign but I do not see any real standard set of SSID's based on station type or anything else that I can determine. Is there a standard or do people pick SSID's for their own purposes?

Lou,

No "official" Standard, but some suggested SSID's are as follows:

-3 ISS/Sat ops
-4 bicycle
-5 sailboats
-6 is when you are doing something extra special like FD
-8 boats
-9 mobile
-10 motorcycles
-11 balloon
-12 jeeps
-13 for RV's
-14 trucks
-15 vans

Some are based on the early days when the SSID you used determined what symbol was displayed by the receiving station.
With the data formats in use today the symbol is usually determined by the coding in the data field.

I have tried snap-on ferrite cores on loops of the GPS cable,
wrapping the GPS cables through a ferrite donut, snap-on cores on the
aux cables between the Opentracker and the radio, and various
grounding straps, but nothing reliably stops the serial noise.

I think the problem is the lack of shielding on the OpenTracker case.
It is too bad that the opentracker is not a bit smaller or it would
have fit into the radio. I may try a T2-Alinco model next, keeping
all the circuitry and wiring (except the GPS) in the radio itself.

How loud is the noise? relative to the data.

I haven't noticed on mine (various OT1 and T2) with
various GPS receivers (12XL, etrex, Deluo old and new,
Jupiter, TripMate, Pharos) so far. Havent tried the
18LVC though.

I am thinking that the noise might be on mine too, but
the level is low enough that it is not disturbing the
reliability of the transmitted data (would be seen
right away as I put one of the OT1 and Jupiter GPS on
3 balloon flights).

4974. Re: [APRS] Re: Serial GPS data shows as noise on transmitted audio

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-26 01:24:41 UTC
From: Scott Miller
Topic: 4954 Message: 4974

In all of my test units since the OT1 days, I'd noticed that with no packet audio present you could make out some digital noise, and I'd always assumed to be crosstalk. I still can't duplicate the noise enough for it to be a problem, but it sounds like it's RFI and not simple crosstalk, at least in some cases.

I'm going to get some OT1+ cases coated with an RFI shielding compound, but I still think there ought to be a better way to resolve the interference.

From: Preston Moore
Topic: 4954 Message: 4975

I have three Opentracker+ all running on F121S radios. I have no pulse on any of them, but these are hard installs in vehicles. I am using a Deluo on one and two US Global Sat BR-??? models(bought very cheap off ebay). I can't offer any other suggestions other than the ones you already tried.

Preston Moore

ve7ltd <dcameron@...> wrote: The noise is there whether I key via the OpenTracker or key via the
microphone. The only thing that kills the noise is removing the
serial data input and output from the GPS to the tracker. I have
tried moving all the jumpers, HI, no jumper, and HT.

I have tried a Tracker2 unit instead of the OpenTracker, and the
noise is much less, but still audible. I think it is an issues with
the RS-232 data voltage being too high, or something like that
causing it to bleed over and modulate some part of the radio.

Is there any way to isolate the RS-232 data better without affecting
the ability for the data to make it to the tracker? I have tried caps
to ground on the data leads of various sizes, and it sometimes makes
it better, sometimes makes it worse.

It is an RFI issue, because if I change the RF field around the
components, the noise can be nulled (antennas, power output, etc).

From: ve7ltd
Topic: 4954 Message: 4978

The noise is about anywhere from 25% to 50% of the level of the transmitted audio. If I was only sending packets out, there would be no problem. These radios are being used on a shared voice/data system, and the voice data becomes unintelligible when the noise is "bad".

I will make a recording of the transmissions as received on a remote receiver and post it on my site for those that want to hear it.

Thanks for the suggestions so far. I am more interested in what could be causing RF to interact with the GPS serial data and cause the radio to go on the fritz like this.

Preston, are you using the OPC-617 external cable to connect these units to the radios, or are you encoding the packets through the microphone port somehow?

Dave-

I am using my own interconnect cable between the OT+
and the 121S. Like this:

http://www.prestonmoore.com/opc-617.html

Pulling the logics out of the OPC-617 should work the
same.

I did forget to mention that I had a temporary setup
in my Camry and actually got pulse nosie from a Deluo
GPS through the AM radio. It was very slight, and
must have gone away when I did the hard mount. I
don't hear it anymore. Can you try swapping GPS units
just to see it the pulse goes away?

Preston

4981. Digipeater Directory/Map Site?

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-26 19:44:28 UTC
From: N5TEV
Topic: 4981 Message: 4981

Greetings,

I travel a lot and was wondering if there a site somewhere that lists/displays digipeaters on a google-like map?

I've search for this for some time. Even a "Digipeater Directory", similar to a repeater directory would be useful.

Cheers,

Jeff

4982. Recommended Radio For Digipeater?

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-26 20:29:52 UTC
From: egroups_n3sw
Topic: 4982 Message: 4982

I am leading a Club project to put a new high wide digi on the air in Cumberland county PA. We have a site at 1460'. The club has authorized the purchase of a KPC3+. We will use an antenna from our inventory or build one at the tower site. My question is, what radio should we buy? We want something that is very reliable, to minimize visits to the mountain. When I asked WB4APR he recommended a minimum of 25 watts output. I am looking for specific radio recommendations from any operators of such digipeaters in the group, to give me a leg up on market research. The Club has a Yaesu 1500M that would be perfect for this job, but unfortunately it is in use for Echolink at another site.
TIA

Try this site: http://aprs.fi/

>
> I've search for this for some time. Even a "Digipeater Directory",

>

Why would that be useful? Your APRS client will display the
locations of active digipeaters on the fly. This would be far more
up-to-date than any published list.

4985. Re: Serial GPS data shows as noise on transmitted audio

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-27 04:27:27 UTC
From: ve7ltd
Topic: 4954 Message: 4985

I have recorded an on air sample of just how bad this noise is. This is with a F121S radio at 5W, antenna located outside, with very little reflected power. The GPS is a GPS18LVC, powered from the internal 5V inside the Opentracker+. The radio is interfaced to the icom using an authentic ICOM OPC-617 cable.

http://www.irlp.net/serial_noise.mp3

The microphone used for recording is sitting beside a large speaker, connected to an Alinco DR-610.

This is when it is at its worst. The deviation of the serial data is 1.4Khz, with the voice peaking at about 2.3khz. The audio is almost unitelligible.

This is repeatable across 13 different radios, 13 GPS units, and 13 Opentracker+ units.

Any more ideas?

Dave,

Thanks for the recording, this helps me in
understanding that the problem is not what I thought
it was.
I was thinking that the noise is superimposed on the
audio of data packets sent to the radio.

But looks like the "hash" noise is superimposed on
your transmission on the UHF band, while an OT+ with
Garmin 18LVC is feeding the VHF side.

My suggestion would to isolate the GPS by:
- supplying its own power
- use optoisolator on the hookup GPS to the OT+
(disconnect the two ground sides)

4987. Re: Serial GPS data shows as noise on transmitted audio

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-27 16:31:07 UTC
From: ve7ltd
Topic: 4954 Message: 4987

Paulus,

There is no UHF side... This is a single VHF mobile radio. The ICOM F121S radio with the OpenTracker+ connected to it is tuned to 144.390 Mhz, and the noise you are hearing the signal that radio transmits when I pick up the attached microphone and transmit voice signals on the same radio that the Opentracker+ is connected to, on the same 144.390 frequency. My application requires mixed voice/data.

Here has been my only viable solution so far:

I feed the serial data from the GPS into the Opentracker+ unit through a 1K ohm resistor on pin 2 of the data port. I then ground pin 2 with activation of the micrphone PTT, through a transistor. This kills the serial data seen by the OpenTracker+ processor, and the noise (of course) goes away (and the Opentracker does not see valid data).

I dont have room within the OpenTracker+ enclosure to add an optoisolator, nor do I currently have any for testing, but that may be an idea for a future design. I have tried the "alternate power source" idea, but that really is not viable for me, and didn't get rid of the noise anyhow. As soon as the ground is attached it comes back.

I was doing a lot of tinkering, and I did find that if I replace the nice Q2 2N7000 FET with a simple 2N2222, the noise is severely reduced, but it is still audible. I am going to be trying several different techniques over the next few days to find a final solution to this problem, even if it involves severing the serial data to the tracker during voice transmissions.

4988. Re: Recommended Radio For Digipeater

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-27 17:56:50 UTC
From: Al Wolfe
Topic: 4988 Message: 4988

Scott,
Pretty hard to beat an old Micor or MRII for this kind of service. Maybe a Mitrek or Exec. Bullet-proof front end. Commecial quality. A synthesized radio is really a waste and can be a liability for digi or repeater service.

Many site managers will not permit ham-grade equipment at their sites. I don't and won't. Not when we have paying users and life-safety users at a site.

Al, K9SI

From: Scott Miller
Topic: 4954 Message: 4989

Keep me updated. I plan to devote some time to this myself (though I
can't duplicate it as well so far) but it'll be Friday or Saturday
before I have a chance to work on it.

I use a TK-760 for my digi, 25W out and using a solar panel and deep cycle battery for over a year now with no problems.

4992. fastest, and simpest way to set up a digi?

Yahoo group: APRS (2007 — 2010)

Although I manufacture APRS transmitters, I have never set up a digi before. It appears that many of you have direct experience with this. What is your recommendation for the fastest, cheapest, and simplest method of setting up a digi?

The quickest way: use a Kenwood D700
- this is just for a temporary digi (i.e. for a demo
at a hamfest)
- might not do WIDEn-N properly, without some changes
thru the terminal port

Next option is using a T2-135 board on a Alinco DR-135
(this might be your first option as for sure cheaper
than the above)

TNC-2 type TNC with UIDIGI EPROM, free if lucky, $40-70 from Ebay
GE PHOENIX-SX, free if lucky, $50-$80 from Ebay
Samlex SEC-1223 power supply, $100

4995. Re:Recommended Radio For Digipeater?

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-28 03:49:17 UTC
From: Richard Sharp, KQ4KX
Topic: 4982 Message: 4995

I'd recommend the Kenwood TM-271A. It is 60W and is built on their (Kenwood) commercial radio chassis and performs very well. It also has "packet" connections inside the radio that you can connect directly to the KPC3+ (avoids using the MIC & spkr jack). You can see a picture of this on Scott's website (http://n1vg.net/). It should be noted that when connecting the receive audio wire there are two options to use as outlined in the operator's manual. It is recommended to use the "PR9" connection for receive. Primarily, this is because the "PR1" pin has an anomaly that if the volume control is turned all the way down (CCW) it mutes the fixed level receive audio present on this pin. The "PR9" pin does not have this issue and provides the fixed level receive audio (un-squelched) continuously. Also, what's nice about using the "packet" connections is you can easily monitor the frequency by simply turning the volume knob up and listening from the built-in speaker. The "PKD" pin is the "PTT" line - I mention this as the manual doesn't indicate that it's the PTT in as simple terms.

The multi-conductor wire that comes with the KPC3+ will work perfectly for connecting to the TM-271A - you can also power the KPC3+ from power inside the radio. The cable can be routed just underneath the DC power wires at the back of the radio. This is actually how the OEM version is routed for non USA versions of this radio. For some reason Kenwood decided not to provide this radio with the packet pigtail cable as they do with the rest of the world. But with a small amount of soldering it works just fine.

Oh BTW, if you use this combination of KPC3+ and the TM-271A be sure to set the XMITLVL command in the TNC for a value of 75. This is the proper drive level for 3 kHz deviation from the KPC3+ TNC.

I have ten of these setup for APRS and packet locally. I also know of three more setups nearby that are setup this same way.

Hope this helps.

Just be aware that there is no such thing as an "European standard".
Andy Pritchard's opinion is his own, and it is not a "general
agreement" within the European region - and the same goes for the
WIDEn-N which many have adopted from the 3 year old north American
"new n-N Paradigm".

In my previous posting in this list, I gave a couple of examples which
are useful for the practical use for you in your area. You will have
to study how digipeaters are set up in your area, including
neighbouring countries (like OZ1IEP's Denmark, different parts of
Norway and Finland, Germany and Poland) before you are going there.

at www.nrrl.no there is a digipeater directory somewhere. It won't
include digis in your country, though.

4998. Irregualar Call Signal

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-28 11:29:18 UTC
From: andershen2002
Topic: 4998 Message: 4998

This message is written in swedish as it is a local issue here.

Jag planerar att programmera om min APRS-tracker på båten.
Är det någon som kan tala om för mig om det är något som hindrar att jag som "Callsign" anger båtens namn som Callsign och anger min anropssignal som "Status text/Beacon comment" i det som sänds ut. På detta sätt har jag ju angivit min signal i allt som sänds även om det kan verka okonventionellt. Anledningen är att folk letar efter båtens namn på APRS.FI och inte hittar någonting. Jag kan växelvis sända korrekt info för att tillfredställa "Vän av ordning" om trafiken skulle irritera någon sådan. Amatörradio är ju till för att experimentera, så varför inte?

Tacksam för synpunkter eller alternativa lösningar.

Med hälsningar
SM0MQP/Anders

4999. Issues with a balloon based repeater

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-28 15:20:02 UTC
From: Jim Tolbert
Topic: 4999 Message: 4999

Hi, all.....

Can anyone guide me to anyone who has flown a balloon based repeater? I am thinking a tethered balloon .. less than 500 ft..... flying for 1-2 days ... as a repeater for SAR operations in areas with out significant hills. It would seem a tracker2 with a lightweight handheld transceiver might work.

What regulations are there on tethered balloon height? Given the weight of the digipeater, balloon, and tether, how big a balloon is needed? Other than wind issues, what other problems have people encountered?

Many thanx..... jt

</swedish>

This reply is written in norwegian even if the issue probably is valid
anywhere (can you legally put the callsign in Status Text/Beacon
comment and use your boat's name in Mycall).

<norwegian>
Det er en kjent diskusjon om kallesignalet m? st? i "Mycall"-posisjon
eller kan legges i Status text. Spesielt diskuteres om du t ex kan
skrive OH/SM0MQP i Status tekst eller om APRS-protokollen m? skrives
helt om for ? f? gjeste-status med.
Jeg regner med at det holder ? gi kallesignalet i Status-teksten eller
"Beacon Comment". Men det kan v?re at b?tens navn ikke passer inn i
"Mycall"; maks er 6 tegn pluss 3 tegn til SSID.
Det er noen som h?rer til gruppen "V?n av ordning" som er helt sikre
p? at CEPT-avtalen krever at kallesignalet inkl "gjesteflagget" t ex
"OH/" skal st? i MYCALL. Men i praksis g?r jo ikke det. Det kan v?re
en ide ? prate med SSA.
</norwegian>

Jim<
I would recommend that you contact the local FAA Flight Service
Station and file a NOTAM (Notice to Airmen). Granted if it is below
500' it may be in Uncontrolled Airspace, and I am not saying it is
required. It is just smart and SAFE particularly if you are
conducting SAR.

Notam filing instructions:

1)Call the FAA flight service station. Either hit 1 to talk to a live
person or just wait until the system kicks you through. This isn't
the NOTAM person, just let this person know you want to file a NOTAM
and they will transfer you to the NOTAM desk (1-800-992-7433) Let
them know who is calling (aka the responsible party) They will also
want phone number(s), both for home and also a launch site number.

2) Launch site radius and bearing from an airport or NAVAID (VOR, NDB,
etc) GPS coordinates may be useful, but not required or usually even
asked for.

3) Give launch time/date in Zulu. (2:00 PM = 1400 + 5 (or 6 for DST)
= 1900 Zulu

4) Give flight duration to Altitude AGL (Above Ground Level) or even
flight level 600 (60000 ft)

5004. Question on UIView w/ TH-D7A(G)

Yahoo group: APRS (2007 — 2010)
Date: 2008-02-29 13:51:36 UTC
From: Earl
Topic: 5004 Message: 5004

Hi everyone,

I'm new to this group but have been using APRS for about a year - I normally use a TM-710A?60Csx in my car, but I received a TH-D7A(G) as a gift and want to interface it to my laptop running UIView. I've cabled a Garmin GPSIII+ to the kenwood and I've gotten a pre-made cable to conenct the Kenwood to the laptop, so I'll need only one serial port.

I'd like to know if anyone else has employed this setup and what the recommended UIView32 settings might be. Since the GPS isinterfaced to the Kenwood, I'm guessing that I would need to use the Shared GPS connection within UIView? I knda thought "no", but am not sure. Any details would be helpful.

One last question: I'm new to UIView, so what would I expect to see re stations and such w/o a map? I can't locate a map for NJ. I just shelled out $100 for a Garmin Mapsource CD and am not pre-disposed to spend another $50 for a UIView-compatible map CD .

Thanks for any input - I appreciate it!

If the GPS is connected to the TH-D7, it will be visible for UI-View
as well (I hear they say).
>
>One last question: I'm new to UIView, so what would I expect to see

In the UI-View yahoo! group, the files area contains a maps folder,
with some maps, and a link to other map sources (non-zoomable maps).
Many UI-View users in the USA are using Precision Mapping 8 and a
special UI-View add-on named PMapServer 7 to see Precision Mapping
maps in UI-View. Those maps are zoomable, but you'd have to pay
Undertow Software for their Precision Mapping 8. The PMapServer is
free.

You might want to join the UI-View yahoo! group.

Hi Jan,

Good thought - I didn't realize there was a UIView group in and of itself. I will check that out. Yes, I don't want to pay Precision Mapping. I'm still hurting from my Mapsource N.A. NT purchase. I have loaded pmapserver. Thanks!

5007. Dive into the Digital Radio Universe with ARRL's VHF Digital Handbook

Yahoo group: APRS (2007 — 2010)
Date: 2008-03-01 03:26:28 UTC
From: Mark Thompson
Topic: 5007 Message: 5007

Dive into the Digital Radio Universe with ARRL's VHF Digital Handbook

ARRL has released a new book on digital operations, ARRL's VHF Digital Handbook by QST Editor Steve Ford, WB8IMY. Today's Amateur Radio operators are using digital radio applications for fun, technical achievement and public service. And it's no wonder -- getting started often requires little more than a VHF radio and a computer. This new book includessuch topics as packet radio, APRS, D-STAR, digital applications in public service and emergency communications and much more.

Without complicated "owner's manual" jargon, ARRL's VHF Digital Handbook presents the material through a unique how-to approach and friendly, conversational style. Readers will understand how to setup and operate their equipment and software and make the best use of their VHF digital station.

Learn about the exciting topics:

? Packet Radio Fundamentals -- All the basics including TNCs, operating commands, and networks (such as DX Packetcluster).

? APRS -- The Automatic Position Reporting System: Track moving objects on maps (other stations, public service vehicles, marathon runners and such). Connect your own GPS receiver and transmit your location -- even as you're moving.

? D-STAR -- Enjoy high-speed digital voice and data on the growing network of D-STAR repeaters.

? High Speed Multimedia -- Discover how you can set up your own wireless Amateur Radio data network by modifying over-the-counter gear such as routers and access points.

? Digital Meteor Scatter and Moonbounce -- Explore weak signal operating using the software masterpiece WSJT by Joe Taylor, K1JT.

? Technical Descriptions -- In-depth information about AX.25, D-STAR and APCO-25 protocols.

ARRL's VHF Digital Handbook is now shipping. Order http://www.arrl.org/catalog/?item=1220 your copy today. This book is part of ARRL's spring publications line-up that includes ARRL's Hands-On Radio Experiments, the 2008-2009 ARRL Repeater Directory and the 2008-2009 TravelPlus for Repeaters CD-ROM.

Date: 2008-03-04 15:55:51 UTC
From: Lonnie Kuhn
Topic: 5010 Message: 5010

I have a mobile APRS unit within my vehicle. I am running a dual band mobile radio, with a KPC3+ TNC hooked up to it. I also have a mobile laptop computer hooked up within the truck. I have been told that I could utilize my vehicle APRS unit as a mobile Digi.
If that is the case, what would the settings be for such a digi?

Right at this time, I utilize the unit for mobile tracking, as well as retrieving messages. I also utilize my mobile APRS unit for SAR by switching frequencies of all trackers, APRS units that are on scene, and utilizing the mapping software to track SAR units in the field.

So I am assuming my question remains, what would the settings be if I was to utilize the mobile APRS/TNC unit in my truck to a mobile digi.

Thanks

Kenwood TH-D7AG. It has built in TNC that does APRS. Just connect the NMEA serial output from your GPS and you are
good to go.

I reiterate, the Kenwood TH-D7Ag is the way to go. Not only do you get the built in TNC that supports APRS but the 'lil rig also features FULL DUPLEX if you decide you want to play FM satellites.

I use my TH-D7A mostly for messaging. I rarely carry it as a voice radio because it's big, uncomfortable in the hand, and has a pathetic battery life, at least with the stock battery.

If you just want something to run as a dedicated tracker, pick up an old HTX-202 or something. You'll pay about 1/6 as much, and have plenty of money left to buy a tracker kit. For about the price of a TH-D7A, you could get a Garmin Nuvi 350 and a Tracker2 and have a nice map display and messaging.

But yeah, it's a decent dual-band voice rig too. And I think if you turn off the TNC the battery life is acceptable.

I had a TH-G71a laying around I ended up getting a few years back and never really using it except on the rare occasion. I bought a Tiny Tracker 3 from Byonics and also picked up a serial GPS from them and the cables to interface to my handheld. Now it's installed in the car in the trunk running off it's own 1/4 wave antenna as a tracker whenever my car is turned on. And if I need a handheld, I just disconnect it and screw on it's antenna and I'm good to go.

I join in with the others, only: I say TH-D7 and omit the A, because
that's the model for America (frequencies etc). You don't tell where
in the world you are living, so look for the model for your place.

5025. Power Spikes to radio ni Car?

Yahoo group: APRS (2007 — 2010)
Date: 2008-03-11 12:37:41 UTC
From: david@gospeltokids.org
Topic: 5025 Message: 5025

I am wanting to run old handheld with Argent Data Systems - OpenTracker
1+,
and serial GPS, for tracking my car, and would like to know what kind of

arrangements are recommended for protecting the gear from power spikes
from modern car ignition systems. I presume it's not best to just
hard-wire all gear into the car power system without some sort of
over-voltage protection?

Thanks!

Jim, there are many experts on the blt@... mailing list when it comes to cross band repeaters and APRS on weather balloons. I have cross posted your question over there. Lets see what kind of responses come back.

Check out these web links of the Houston BLT team's recent balloon launches.

YOu are doing the right thing David, I'm speaking from 3 times $100 experience. Your car is unknown, your radio specs are unknown. For best results, DO NOT plug directly to the cig lighter. Yea and now there will be 1000 replies SAYING "bs, I've been doing it for years" but this is your radio so take care.

I don't know your power requirements but you can simply research the internet for electronic circuits to suppress spikes; go to a car stereo shop and purchase a quality suppressor; use either a Yaesu/Icom/Kenwood cig lighter adapter for low current.

A good suppressor will have current limiting, a large choke AND one or two capacitors across the output.

Pretty simple prevention, expensive repairs.

The Tracker2 is built to be a little more rugged for mobile applications
- it's got over voltage, reverse bias, and over current protection built-in.

For the OT1+ I think I'm going to start offering an alternate voltage
regulator that has a lot of the same protections, and it's built
specifically for automotive applications. It's considerably more
expensive than the standard one, though, and it only handles 250 mA max,
so I'm not sure I want to make it a standard part.

Remember that if you wire direct to the battery you want to fuse both
sides. If the car's ground connection gets flaky, you don't want the
starter finding a path to ground through your equipment.

From: Peter Dakota Summerhawk
Topic: 5025 Message: 5029

I do commercial radio installs, NEVER plug the radio right in to the cig lighter. Better to filter the power and fuse both sides of the feed to the radio. I use a quick disconnect on the power cord and fuse both sides and if possible wire directly to the battery, if not I find a spot in the fuse box that is NOT being used and wire it in there. Most of the time we recommend a battery monitor that will shut off the battery if the voltage gets to low and all you have to do to override is hit the headlights switch. To much usually run into the circuit for the cig lighter to begin with.

5030. KAM doesn't trig the transmitter

Yahoo group: APRS (2007 — 2010)
Date: 2008-03-13 09:04:22 UTC
From: Jan, LA2BBA
Topic: 5030 Message: 5030

My KAM which has been doing a nice job for quite a few years, won't transmit any more.
When my APRS application sends its beacon for RF, nothing happens (or so it seems) in the KAM, and the radio doesn't transmit.
The computer _is_ wired to the TNC (the TNC accepts the startup commands), and the TNC _is_ wired to the radio.

will it decode packets properly?

I had the same problem with my KPC3+ and it ended up being a shorted wire going from the radio to the TNC. If its a homebrew cable you may want to check your connections to ensure nothing is shorted.

Has anyone ever really damaged a rig by running the cig lighter?

I've run forever with temporary installs because of my job desc. Heck,
right now I've been running my d700 in a tractor trailer with the power
cord soldered to a spade and shoved in the fuse block, and the ground,
which often slips off, screwed down with a dash bolt. When it slips off
I usually run only the ground via the coax until I get back to the barn!
Horrendous? Maybe, but you'd never know with the 250k miles it's been
run that way.

Yeah, I know, it's not the most efficient way, but I make my contacts.

I have had several people try to run off the plug and they either melt the plug cause its drawing to much current or fry the radio altogether. I don't recommend using the plug for power. The best place is the battery if it's long term or the fuse box on a non used spot if you can't get to the battery. People think the lighter plug can be used for high amp applications and it just doesn't work that way over a long period of time.

5035. Alternate Input Digi - Simple Implementation?

Yahoo group: APRS (2007 — 2010)
Date: 2008-03-14 19:57:50 UTC
From: yeagerre
Topic: 5035 Message: 5035

I would like to set up an alternate input on my high elevation/wide coverage digi. The would receive packets on an alternate input frequency (like 144.99), and digipeat them on 144.39. The question is, how to do this with a fairly simple set up that is appropriate for a mountaintop setting.

Bob WB4APR has suggested that I might do this efficiently by adding a TNC and radio at the site, and making the following connections:

1. Tie the TX audio of the second TNC to the existing radio (in parallel with TX audio from the existing TNC). When the second TNC digipeats a packet, the audio goes to the existing radio and is transmitted on 144.39

2. Tie the PTT output of the second TNC to the existing radio (in parallel with PTT from the existing TNC). This is also to allow the second TNC to transmit on the existing radio on 144.39.

3. Connect the XCD input of both TNCs to the PTT line. This is to prevent either TNC from transmitting while the other TNC is transmitting.

This all seems to make sense to me, but I'm curious... has anyone out there done this? Have any tips to offer?

Thanks & 73 de Paul W4SKI

The cables haven't been changed since I got the KAM some 6 years ago,
so I hardly think they can be the matter. It ran (at least) three
weeks ago, but then we had a 2 sec line power failure. It could have
been then.

sURE Eric, but you didn't read the entire thread. Most radios will run from the cig lighter and maybe 9 out of ten won't have a problem but then there is that one radio or one lousey car/truck and bingo, no radio, no GPS, no repairs. Might as well do it right the first time, take Peter's advice..... Bill K6ACJ

5039. TinyTrak3 to GM-707A

Yahoo group: APRS (2007 — 2010)
Date: 2008-03-17 07:27:55 UTC
From: Bob MacDonnell
Topic: 5039 Message: 5039

Perhaps someone can save me from reinventing the wheel.

About 5 years ago I purchased a TinyTrak3 kit and interfaced it to my Kenwood GM-707A, using it in North America and later in Australia.

It has been sitting unused, along with the homebrew cable, for a few years now. I dusted it off, and the TinyTrak3 appears to work okay but does not key the Kenwood. The Kenwood data connector on p62 of the instruction manual does not show a PTT input.

What is used to key the tx???

'Of all the things I've lost, I miss my mind the most!'
Thanks for whatever info may come forth. It's likely a common combination,
Bob MacDonnell in Brisbane

Pin 3: "PKS" or "packet standby". For some reason, Kenwood often uses the
term "STBY" in their schematics to indicate the PTT line.

Some rigs are keyed through the resistor capacitor network on the mic element output but the 707 should be the same as others with a separate PTT pin. I'd recheck the 707 docs and also join the tinytrak3 Yahoo group where there should be lots of answers. Try the new TT4, they are bidirectional, works with APRS and Packet .... see Byonics.com

5043. 710 radio with Garmin 18 - need help

Yahoo group: APRS (2007 — 2010)
Date: 2008-03-17 23:05:17 UTC
From: robert long
Topic: 5043 Message: 5043

ok - fellows... Robert here... I need a wiring (pinout) diagram for
the "serial" Garmin 18 GPS puck (the one with the power/cigarette plug).

What I need to know is: how to splice and solder my gps18 into the plug
that goes into the 710 kenwood.

Anybody know what and how I can accomplish this?

Thanks - robert

Off the top of my head, I think it should be white = data out, green = data in (not needed), red = power (5 volts, not sure if that's there on the PC version) and black = ground. At least that's how it is for the LVC version.

You still need the 12 volt adapter to power it, since the Kenwood doesn't provide 5 volt power.

Honestly, from a sweat equity standpoint, the best option in my opinion is go to the Byonics website, and get a Serial to Kenwood plug adapter. With slow shipping I think total price is under $25 USD to the continental US. They have both male and female serial plugs that adapt to the Kenwood 1/8" stereo plug.

Dont have to worry about diagrams, soldering, crimping, strain relief, bad workmanship, messing with a 1/8" 3 element male plug, and all that crap (hint.. i tried to do it too, then bought the damn cable).

Thanks Bill, the info was on the TinyTrak forum.

And now I can read the scribble in my notes as 'gnd to tx'. :-)

The pin ID is 'PKS' = 'Packet Standby'. I'm sure there is logic there somewhere.
Cheers,
Bob

Hi,
You might want to try gpsgeek.com; I have purchased 2 Kenwood-related cables from them and have found the cables to be well made.

One cable included the Garmin 4-pin round connector, the Kenwood mini phono and a 12v Cig adapter (for the GPS). The other was a Kenwwod mini phono to DB9.

I recommend gpsgeek.com

5048. NRZI transcoding

Yahoo group: APRS (2007 — 2010)
Date: 2008-03-19 13:53:34 UTC
From: OH2FIA, Juan Carlos Borrás
Topic: 5048 Message: 5048

Hi all,
I'm coding an APRS software decoder: roughtly speaking It takes an audio stream and locates HDLC frames, once it locks in it decodes the APRS packet.
My problem is that even though the HDLC flag detection works, whatever I get after is mostly garbage, so I wonder if I am decoding NRZI properly.

That is, I understand that the last bit of the HDLC flag is 0, which translates into a "Mark" symbol, then whatever bits come after they are encoded in the same way:
- if previous bit was 0 and now it comes a 0 then "Space" (S)
- if previous bit was 0 and now it comes a 1 then "Mark" (M)
- if previous bit was 1 and now it comes a 0 then "Mark" (M)
- if previous bit was 1 and now it comes a 1 then "Space" (S)

Hence for the following bit stream made by an HDLC flag and a single byte :
0111 1110 1010 1010
The NRZI encoding would be:
SSSS SSSM MMMM MMMM

Accordingly 0111 1110 1010 1010 would correspond to SSSS SSSM SMMM MMMM

Am I correct?

Thanks in advance.
Cheers,

Juan Carlos, OH2FIA

5049. Re: [APRS] NRZI transcoding

From: Michael Gray
Topic: 5048 Message: 5049

I think it is the other way around. An unencoded value of 0 would cause a change in the A-FSK frequency.

So if the incoming stream is 0>1 or 1>0 that is a value of 0.

A 0>0 or 1>1 is a value of 1.

The following is a link to my open source UI frame TNC.

http://kd7lmo.net/pc_source.html

Look in the function tncTimer() for the TNC decoder. Start at the comment line '// NRZI decode the incoming data bit.'

From: Scott Miller
Topic: 5048 Message: 5050

I don't blame you for getting this wrong - most of the docs out there
are wrong or incomplete!

Which tone you call 'mark' or 'space' is really irrelevant. A change in
tones is a 0, no change is 1. A very important and poorly-documented
detail (it's wrong in the original AX.25 spec) is the concept of bit
stuffing. Except in the HDLC FLAG (and frame abort or whatever the
other one is), any run of more than five 1's is followed by a 'stuffed'
0. This avoids long, unchanging tones that cause the receiver to lose
lock. The stuffed 0 is ignored on the receive side.

Using H for 2200 hz and L for 1200 hz, take the following example,
showing the first two bytes of a frame:

01111110 11111100 becomes
01111110 111110100 (since the FLAG doesn't get stuffed) which is
LHHHHHHHLLLLLLHHLH if I did that right.

It could also start out with H, in which case the rest would be reversed.

It's not the easiest code to follow, but here's the Tracker2's NRZI,
HDLC, clock recovery, and bit stuffing code, which takes a raw
demodulator input from an NJM2211 (or MX614, TCM3105, or whatever).

https://svn.freepository.com/50lItuLQ7fW6s-web/browser/OpenTracker/trunk/sources/demod.c

I also wrote up some notes on things I learned the hard way about packet
here:

http://n1vg.net/packet/

Hope that helps,

Scott

5051. Re: Power Spikes to radio ni Car?

Yahoo group: APRS (2007 — 2010)
Date: 2008-03-20 15:51:45 UTC
From: wa6mhz_1
Topic: 5025 Message: 5051

I have had considerable problems over the years with Power spikes resetting the TNC, causing it to be in need of a reprogram. So I developed a foolproof system that works every time. Err, almost! The DC in from the car comes from the fuseblock where I found a point that would be active upon car ignition. I only want the tracker to run while I am driving and have no chance of battery drain. So I built a time delay circuit using a transistor with a big capacitor on the base. It takes about 5 seconds for the base voltage to rise to .7 volts, which at which time it keys a relay which connects up the tracker to +12. This worked great until I put in a HF rig in the car, and found RF from the HF would mess with the transistor, causing it to reset. I had to shield the assembly very well and put alot of ferrite beads everywhere to keep the RF out of the timer box. But once cured, it works flawlessly, and there is no chance of power spike messing with the Tracker. Easy circuit! Give it a try!

5053. Six Meter APRS Experiment this weekend.

Yahoo group: APRS (2007 — 2010)
Date: 2008-03-21 14:23:31 UTC
From: ka2zev
Topic: 5053 Message: 5053

Six Meter APRS Experiment this weekend.

Reason.
Bob B. WB4APR has an idea for a nation wide short message APRS system
using meteor scatter propagation.

Like most huge projects it has to start small.
The idea is to get `something anything' on the air and see how it
works.

Any system on six meters is going to have different kinds of
propagation.
Direct, sky wave, and if we are real lucky meteor scatter.
At this point there are no meteor scatter controllers in existence.
I need to use common hardware for this project.

The short term goal is to duplicate the success that two meter APRS
is but do it again on six meters. Prove that the hardware works and
there are no major snags in the technology.

I prepared a mobile radio and installed in it a Byronics TT3
controller.
For the last two weeks this unit has been on and off. Been solving
small tech issues with the adaption. The last two outings the unit
has been a solid performer. Now seems to be a good opportunity to
go `prime time'.

This is the construction article for the project.
The goal was to adapt cheap surplus radios for this new service.
Midland Syntech 1 units can be had for peanuts.
The beauty of using converted commercial radios is the same set of
modifications that work on six meters, will work on two meters, and
on UHF radios.
So if you're thinking of a conversion project, this is very cool.
If you need help programming up Midlands non standard e prom module,
catch me off line for assistance.

http://www.flickr.com/photos/90108848@N00/sets/72157604093886156/

I've made three radios this way. So far so good.
As of right now it is chirping out of the parking lot here at work.

Duration of the test.
From 06:30 Friday the 21st to approximately 18:00 on the 24th.
I will leave it on over night from the home address.

Frequency
I will be operating the above mobile APRS station on 50.62mhz.

Expected AO
This station will be operating out of my truck in the Northern Virginia area.
Near Dulles Airport (IAD). I may or may not be traveling this weekend with it.
The transmitter makes between 45 to 50 watts into a loaded ¼ wave whip.

http://www.flickr.com/photos/90108848@N00/2327502257/in/set-72157604097911658/

The internal timer of the Byronics is programmed to key every 120 seconds when it's in clear air. This was done as a battery saver. If we need a faster time for testing, that's an easy thing to change. In the event of local interference or other signals the controller holds off the transmitter until it's clear.

I've programmed a message into the controller. The message says it's an experimental station and has my call sign KA2ZEV and phone number.

Related Projects.
I'm constructing two base stations that will be available within the week.
This article is about that effort. Consider it a `work in progress'. I hope to finish the article when the two radios are complete.
http://www.flickr.com/photos/90108848@N00/sets/72157604141562372/
If you currently have space in your station and want to add 6m APRS to your system, we have a deal for you.

Bob WB4APR has issued me two MFJ packet modems to integrate with the converted 100 watt radios that I am donating. If you have about 22 amps of available DC power, an antenna, and a connection to the reporting system, we can loan you one of these radios.

If you're interested in building units, the above articles can point you in the right direction. We would like to get more mobiles and base stations on the air.
I can't make them all. For this to work, we need more stations.

Contact data
The best way to reach me is via e mail. ka2zev@...
The phone will be on after 16:30 today at 703 863 4574.
I work in a government building that cell phones are discouraged in. This might be most suitable.

Install a toggle switch on the power line so that after the car is
running, you can switch on your gear. One extra step but ??
Works for me.

From: robert long
Topic: 5055 Message: 5055

thanks for all your input on the 710a... connected to my garmin GPS18...

I have read all the input you all have given me and I appreciate all comments...

One more question... I now have my 710 "beaconing" and everything is indicating "OK".

But - now I wish to connect my laptop, which is running APRSpoint software to the radio. Which port do I have to plug in the cable to?

Comm, PC, data.... and in which port - - I mean the back of the radio, or the control head?

Thanks for your help.

Hopefully, I can use the APRSpoint software to plot other aprs units on my screen - moving map.

thanks

That's okay Don for you fellows who still have live brain cells!

I like to keep a Megapulse battery desulphator in my Troopcarrier RV in Oz. It goes unused for months at a time. The RF noise it makes is not conducive to good am commercial station reception, or HF reception, so I've put in a couple of latching relays which power the Megapulse through short leads and unpower VHF/UHF radios when a door is opened. With doors closed the toggles reverse the first time the brake is touched. No relays are left energized for long periods except when a door is left open.

Sounds Rube Goldberg but those wires were easy to access. I already had a Sonalert on the door switch to alarm lights left on, so had to put in a diode to prevent the Sonalert whining if the auxilary battery was low.

The schematic has been uploaded to the group files.

5057. APRS-IS Server Use Question

Yahoo group: APRS (2007 — 2010)
Date: 2008-03-22 21:39:41 UTC
From: Vince Staffo
Topic: 5057 Message: 5057

I recently setup one of my PCs to use UI-View as an Internet APRS-IS Station only. I have it setup and all seems to be working well with a Tier 2 server connection.

To insure I am using the Server setup properly I have a question regarding the use of the servers.

I have been able to determine there are 3 different types of servers.

CORE (Tier 1), Tier 2 and Rotate.

What I am lacking is an explanation of what server an End Use like myself should be using, plus what a Rotate Server does. If there is a Website or link that would explain this that would be helpful also.

Thank You,

Vince WB2FYZ

Hi, Vince:

You have it right - end users such as you and I connect to the Tier 2 servers. Here's a quick description: http://www.aprs2.net/

'Rotate' will connect you to a different Tier 2 server every time you connect.

73,
Mike N5UKZ

5059. TAPR Packet Status Register (PSR) Deadline is Near

Subject: [tapr-announce] Packet Status Register (PSR) Deadline is near

Packet Status Register (PSR) is looking for a few good writers,
particulary ham radio operators working on the digital side of our
hobby, who would like to publicize their activities.

You don?t have to be Shakespeare to contribute to PSR and you don?t have
to use Microsoft Word to compose your thoughts. The PSR editorial staff
can handle just about any text and graphic format, so don?t be afraid to
submit whatever you have to wa1lou at tapr.org .

The deadline for the next issue of PSR, the Dayton Hamvention issue, is
March 31, so write early and write often.

73,

Stan, WA1LOU
PSR Editor

5063. Control fields with other values than 0x03

Yahoo group: APRS (2007 — 2010)
Date: 2008-04-01 13:59:03 UTC
From: OH2FIA, Juan Carlos Borrás
Topic: 5063 Message: 5063

Hi all,
It's quite common, at least for me, to receive APRS packets whose
control field is 0x01 or 0x02 which goes AFAIK and IMHO against the
APRS spec which states the Control Field must be 0x03.
Packets with such strange values have Destination Address different
from the ones states in the APRS spec. Also de SSID is not a number
smaller than 15.
A example of such packet would be (fields are comma separated:
DST,SRC, REPEAT,CTRL,PID, INFO,FCS):

VP4S88-0, OH3HS-y, OH3RCD-p, 01, F0, &4KdnrN/]"51=Timppa ja v-sininen
MGM-624, 819D

Would someone be kind enough to add some light to this particular matter?
Thanks in advance.
Cheers,
JC!

5064. APRS SIP location services

Yahoo group: APRS (2007 — 2010)
Date: 2008-04-04 13:38:45 UTC
From: Clint Gray
Topic: 5064 Message: 5064

Is there an effort to provide SIP like location services functionality using APRS? I would like to have a quick way to identify what channel I can be contacted on. If I am in the range of an echolink node I would like to share that with others. Having a predefined filled in the APRS packet could be a quick way to do that. Any thoughts?

5065. Re: APRS SIP location services

Yahoo group: APRS (2007 — 2010)
Date: 2008-04-04 20:29:53 UTC
From: Clint Gray
Topic: 5064 Message: 5065

Further clarification:

SIP provides 5 basic areas of support:
1. User Location: Determination of the end system to be used
for communication. In other words, determination of the current
network address of a participant. This feature allows users to find
other users without having to know details about their physical
location or device addresses.
2. User Availability: Determination of the willingness of the
called party to engage in communication. This feature is known as
presence, where availability information is visible to other users
who have subscribed to a participant's presence information. We will
discuss presence in detail further on in this module.
3. User Capabilities: Determination of the media and media
parameters to be used. This allows the session participants to agree
on the features supported, where perhaps not all participants
support the same level of features. For example, video speed and
audio codecs may be supported differently.
4. Session Set-up: Ringing or establishment of session
parameters at both called and calling party includes the invitation
from the calling party and the acknowledgement from the called party.
5. Session Management: Management features such as transfer,
hold, and termination of sessions, modifying session parameters, and
invoking services.
I would like to see SIP like functionality added to APRS and other
packet network functions like WINLINK.

Two key features missing are:

Presence and Capabilities: Adding these to the APRS message in a
standard format that can be queried from a SIP server could fill the
void.

As you move from location to location it would be great to be able
to update your Capabilities and Presence. I am in range of and
taking voice calls on Echolink node 123 and am taking email
notifications at xxxx@.... With APRSlink you should be
getting notifications that you have new mail.

That is the type of functionality I am referring to.

From: OH2FIA, Juan Carlos Borrás
Topic: 5064 Message: 5066

There is no specific packet for reporting availability of Echolink
connected repeaters but it's quite common to notify station
capabilities in the comments section of position report packets.
The same applies for SIP services.
A neat thing of APRS though is that neither Echolink repeaters not SIP
servers need to transmit APRS but a single APRS station in your local
radioclub can keep your surroundings informed.
Just keep the desired routing path very short (WIDE2 or less).
Bulletin packets can be used too. Since the ammount of params relevant
to SIP session can be quite large, you'll be forced to use several.

5069. Problem connecting APRS+SA to PK-232 MBX

Yahoo group: APRS (2007 — 2010)
Date: 2008-04-05 17:13:53 UTC
From: Dick True
Topic: 5069 Message: 5069

Upgraded my PK-232MBX to the latest hardware and software (has the PSK label on the front). XPWare for windows connects and works great with all modes (I'm also on Vista Premium and connecting via a USB to serial port device). UI-View32 Also makes the connection just fine. However, APRS+SA (version 2.28) will no longer connect to the PK-232. After loading the program there is no activity in the TNC window and during the load of the program the PK-232 never changes any lights (just the Baudot light remains on after power up). So it appears the APRS+SA program is not initializing the TNC. I have tried multiple setups but nothing seems to work. Yes, the serial port is correct in the TNC-1 port setup. Here is the pk232.tnc initializing file APRS+SA uses:

```
EXP on
ALFP off
ACRD 0
ALFD off
BBSMSGS off
MON 2
MXmit off
Mto ALL
MDIGI on
DFrom all
Echo off
FLow off
FULL off
PACLen 128
MSTamp off
NEWmode off
MRPT ON
HEA off
DIGI off
B E 180
BT =4039.66N/11155.86W-PHG5160/Taylorsville, Ut. w7sae@...
```

This file worked ok before the PK232 upgrade.
Would appreciate any ideas on what I might do next.

Dick

I've never had any trouble with UV in the car - I think car windows are supposed to be UV-opaque. There's some marking on my windows to that effect, at least. I'd be more worried about the heat buildup.

How about throwing an old? white cloth over it? That won't attenuate signals significantly and will reflect light/heat somewhat. It also keeps the hardware out of site/temptation.

Come to think of it, if your GPS has the ability to connect to an outside antenna, there are many manufacturers who make them - they look like little hockey pucks. That way, you could mount the antenna on the car and then put the GPS unit completely out of site (and out of the sun) - if that'd work for your application...

A lot of those GPS/antenna puck units are pretty poor quality and only
have a USB interface. Navman makes a more industrial one that has RS-232
or USB.

http://www.navmanwireless.com/oem/gps/gps-navigation/gps3260-oem

Less than $100 and I have one in the Arizona sun that works just fine.
I've seen it hit 140deg F (+60degC) with the IR thermometer.

My old Deluo's been kicking around on the rear deck for years now with
no problems. I did get 20% tinting put in a while back which probably
cuts down on the heat quite a bit, though.

http://www.byonics.com/tinytrak/gps.php

The GPS2 is more sensitive than the GPS1, draws less current, and is built with the SiRFstar III chipset. It has the same DB-9 connector as the GPS1. It features Wide Area Augmentation System (WAAS) to provide unmatched accuracy and performance. It has an on-board rechargeable battery for fast satellite acquisition during power-up, and requires 5V to operate. Tracking up to 20 satellites, the Byonics GPS2 can be used with almost every major mapping software (NMEA 0183 v2.2 data protocol).
The GPS2 unit comes with an internal magnet for versatile mounting options, and is water resistant.
It draws 65mA typically, and will work to an altitude of 18 km and speed of 515 km/h.
$69.00

This is the best deal on a GPS "hockey puck" receiver around, in my humble opinion.

From: Mark Thompson
Topic: 5084 Message: 5084

2008 ARRL/TAPR Digital Communications Conference Issues Call for Papers (Apr 8, 2008) -- Technical papers are solicited for presentation at the 27th annual ARRL/TAPR Digital Communications Conference (DCC, http://www.tapr.org/dcc.html), Friday-Sunday, September 26-28, in Chicago, Illinois. Papers will also be published in the Conference Proceedings. Authors do not need to attend the conference to have their papers included in the Proceedings. The submission deadline is July 31. The ARRL/TAPR Digital Communications Conference is an international forum for technically minded radio amateurs to meet and present new ideas and techniques. Paper/presentation topic areas include -- but are not limited to -- software defined radio (SDR), digital voice, digital satellite communication, digital signal processing (DSP), HF digital modes, adapting IEEE 802.11 systems for Amateur Radio, Global Positioning System (GPS), Automatic Position Reporting System (APRS),
Linux in Amateur Radio, AX.25 updates and Internet operability with Amateur Radio networks. Submit papers to Maty Weinberg, KB1EIB, ARRL, 225 Main St, Newington, CT 06111 or via e-mail, maty@.... Papers will be published exactly as submitted, and authors will retain all rights. ARRL will provide additional information on the 2008 DCC as it becomes available.

5085. AMSAT / TAPR Banquet at Dayton Hamvention

Yahoo group: APRS (2007 — 2010)
Date: 2008-04-10 20:09:36 UTC
From: Mark Thompson
Topic: 5085 Message: 5085

2008 AMSAT / TAPR Banquet at Dayton Hamvention

The second annual joint AMSAT/TAPR Banquet will be held Friday evening, May 16, 2008. The Banquet will be at the Kohler Presidental Banquet Center, Kettering, OH.

Reservations are required and must be made by Monday, 12 May 2008. The price for the Banquet is $25 per person. Tickets can be picked up at the AMSAT booth at Hamvention on Friday, or at the door.

Please contact Martha (martha@...) at the AMSAT office for information or call the office to make reservations. You can reach Martha from 10:00 AM to 6:00 PM EDT at (301) 589-6062, or in the US toll free at (888) 322-6728. Presidents Club Gold members should let Martha know if they are attending the banquet.

6:30 PM Doors open and Cash bar is available with Beer, Wine, Liquor and soft drinks.

7:15 PM Buffet Dinner service begins. The Center has a reputation for good food and service. The Banquet will be in the Lincoln or Kennedy room.

MENU
Fresh mixed green salad with assorted dressings
Roast Prime Rib of Beef au jus - carved on site
Marinated Roasted Garlic Rosemary Chicken Breast in lemon butter sauce
Salmon with Newburg sauce
Whipped potatoes
Normandy blended green beans
Fresh fruit bowl
Roll and butter
Coffee/ iced tea/ water
Assorted pies

AMSAT - Dayton 2008
The 2008 Dayton Hamvention will be held this year on 16 - 18 May 2008. This is the 57th year of the Dayton Hamvention, sponsored by DARA (Dayton Amateur Radio Association). AMSAT will again occupy the same booths 444-448 plus a new booth 449, across from the ARRL area. It is anticipated that the attendance for Hamvention will be larger in 2008 than in previous years. Make your reservations early for all AMSAT activities!

As has been the case for the many years Hamvention will be at the Hara Arena Complex on the north side of Dayton. Further information on Hamvention 2008, including advance ticket sales and motel accommodations, can be found at www.hamvention.org.

AMSAT has a limited block of rooms reserved at the Hampton Inn in Fairborn, OH. Please contact Martha at the AMSAT office for room price and availability during Hamvention. Priority for rooms will be given to those volunteering to work in the AMSAT booth for multiple 2 hour shifts during Hamvention. The phone number for the AMSAT office is 301-589-6062. Other hotels in the immediate area of the Hampton Inn include the Fairfield

Inn, Ramada Inn, Fairborn Holiday Inn, Red Roof Inn and the Homewood Suites if additional accommodations are needed.

SOFTWARE DEFINED RADIO
Saturday, May 17, 2008 0900 - 1130 - Forum Room 1
Moderator and Speaker
Eric Ellison, AA4SW
Speaker
Scotty Cowling, WA2DFI
"Hands-on SDR Projects"
The phenomenal Software Defined Radio paradigm shift continues with a significant number of ?off the shelf? as well as amateur hardware offerings. Many programmers are fueling the fire! Come hear the leaders in this movement describe the vast potential of this rapidly advancing technology.
This forum will give an overview of some SDR projects and show you how to get started. Are you are an experimenter or a designer, how can you contribute? Even if you only want to find out what SDR is all about, this forum is for you. Topics will include: Basic SDR architecture, HPSDR project status, useful test equipment, SDR computer hardware requirements, and SDR software.
Speaker
Phil Harman, G3WXO, VK6APH

"Fully Digital HF Radios"
This forum will explain the techniques that are used in a new generation of fully digital HF radios and discuss their advantages, disadvantages and performance in comparison to conventional analogue radios. These new radios digitize the received signal directly at the antenna socket and generate the transmit signal directly in the Power Amplifier.
Speaker
Frank Brickle, AB2KT
"SDR in the Clouds"
This forum will discuss the art and science of designing and implementing a remotable station in the new world of Software Designed Radio.
For a variety of reasons, hams are becoming very interested in using their radios remotely. Typically this means locating the control devices in one place, the radios somewhere else, and possibly the antenna system at some distance from the RF hardware as well. And what a given piece of the system does, corresponds pretty much
exactly to where it's located physically.
With Software Defined Radio, the physical locations are suddenly a lot less important. The functional distribution of system components can be much more flexible. Some of the ?radio? parts can be on one place, other parts elsewhere, or some functions can be completely transposed to a different chunk of the system.
We will cover both theoretical and practical issues involved in building a system that's tailored to different kinds of high-performance requirements, such as multi-multi contesting or weak-signal VHF.
An Atlas Motherboard, and Ozymandias USB computer interface, the basic building blocks of a High Performance Software Defined Radio will be given away as a door prize, at the end of the session. You must be present to win.

Scott,

Looks like much the same animal. I don't have manufacturers specs, but it looks like they are similar in all respects except in waterproofing (Yours works under water? Cool!) and the Byonics unit claims lower current consumption, and an on-board memory battery. Your prices are awesome!

Allen

The ADS-GM1 has the same SiRFstar III engine as the GPS2, same tracker-style DB9 connector, better waterproofing (IPX7 rated, works submerged) and it's $16 cheaper, with quantity discounts available. And it's in stock.

They're pretty similar. The GPS2 is manufactured by Polstar, and the
ADS-GM1 by Progin, both in Taiwan.

GPS reception isn't good underwater, but I did leave one submerged a
couple of inches for a few days just to try it out.

They've both got on-board batteries (or some form of nonvolatile
storage, anyway) so startup time is similar. I think the current
consumption is very close, too - I've got the Deluo-branded version of
the GPS2 and without a good low-range integrating watt meter I couldn't
say if there's any real difference.

The ADS-GM1 comes with a mounting suction cup, which is probably worth
at least another 30 cents. =]

Hi all

With the integration of the GPS into cellphones has anyone developed an application to send APRS data via the GSM network??
For example the blackberry curve, Some late model Nokia phones all have GPS function.

It would be cool to be able to send that data via the cellular network, to create a person icon on an APRS screen.

Any ideas???

Here's a repost with link to pictures. The red wire seen in D700_2 is a ground for the cable shielding in an attempt to get rid of the gps data hash on HF. It didn't work.

Thomas C. McDermott, N5EG

Dayton Hamvenion Technical Achievement Award: Tom McDermott, N5EG
The Hamvention Technical Achievement Award goes to Thomas C. McDermott, N5EG, for his "more than 20 years of involvement in projects which further the development of Amateur Radio." According to Hamvention, McDemott co-developed the TexNet packet switching network in 1986; based on datagram routing, it covered much of the South Central United States in the 1990s.

McDermott, an ARRL Life Member, received the Doug DeMaw, W1FB, Technical Excellence Award in 2004. Licensed for almost 40 years, he is a member of the IEEE and holds a bachelor's in electrical engineering. His Amateur Radio interests lie in HF digital communications, hardware and software design, and an occasional HF contest.

McDermott was the founder of the Texas Packet Radio Society. As part of that group, he designed the hardware and some of the protocols for the TexNet packet switching network; he has been involved in numerous TAPR http://www.tapr.org/ projects and has written a textbook on wireless communications. McDermott holds eight patents.

Hi Mike,

Aside from the TH-D7, there aren't any commercially available handheld solutions that I'm aware of. I know it's possible to have an OT1+ directly drive a cheap LCD module, or even drive one of the more expensive serial LCDs. I heard that Byon is working on a new TT4 version? But haven't heard any firm dates.

It would be cool if someone published the firmware and wiriing diagram necessary for the OT1/LCD solution -- that would be a cool and simple project that would fill a much needed hole.

Hello, all!!
Is there any way to make an APRS system announce every call sign that comes in via the APRS system? I'm using a Kenwood D-710A and an AvMap Geosat 5 GPS. Do I need to hook up a laptop to my system to speak the call signs?

Please visit <eveythingyoucanget.com> and select "Ham Radio" for my web page!

UIView32 does that, but as it runs on Windows you'd need a laptop.

I found a gentleman who builds a zero-crossing aprs decoder that he sells on E-Bay for about 15.00. You feed it audio and it spits out 9600 Baud data. I married one to a Scott Edwards serial LCD as a bench-top tool and it works great. You will have to google him. The data is very raw, but useful anyway.

From: Scott Miller
Topic: 5094 Message: 5099

> It would be cool if someone published the firmware and wiriing diagram
> necessary for the OT1/LCD solution -- that would be a cool and simple
> project that would fill a much needed hole.

Here's a picture of my test setup:

http://n1vg.net/opentracker/images/ot1plus-display.jpg

Looks like I didn't publish the compiled firmware (I can provide the
file if anyone's interested) but it's in the main source repository here:

https://svn.freepository.com/50lItuLQ7fW6s-web/browser/OpenTrackerPlus/trunk/sources

The wiring setup depends on how you've got the macros set up in
hd44780.c - right now it's like this:

```
8 #define LCD_RSPORT PTB
9 #define LCD_RSBIT 4
10 #define LCD_PORT PTD
11 #define LCD_MASK 0x0f
12 #define LCD_SHIFT 0
13 #define LCDclkhi PTB |= 0x20
14 #define LCDclklo PTB &= 0xDF
15 #define LCD_RS 0x10
```

So it's using port B bit 4 for RS, port D bits 0-3 for data (that's the
0x0f mask) and port B bit 5 for clock. I'd have to check the OT1+ SMT
schematic to see which pins each of those goes to.

The hd44780 interface code it pretty ugly - it predates the OpenTracker
by a couple of years, and it got reused from some older projects. I did
clean it up a little, though.

As for making it do something useful, this is all I added for the demo
(in packet.c):

```
188 #ifdef DISPLAY
189 LCDclear();
190 LCDwriten(srccall, 9);
191 LCDwrite(">");
192 LCDwriten(destcall, 9);
193 LCDgoto(0x40);
194 LCDwriten(packet_data,20);
195 #endif
```

This clears the display (and returns to the home position), writes up to
9 characters of the source call, a '>', and up to 9 characters of the
destination call, then skips to the second line and writes up to 20

characters of the packet payload. Obviously this could be changed to use a larger display - IIRC, they still start the second line at 0x40, so you'd only need to change the length on the last LCDwriten() call.

You could easily adapt it to only display (for example) APRS text messages addressed to you, or to show packets only from a given source.

5100. How can I forward information from APRS to the DX Cluster and not just APRS dx

Yahoo group: APRS (2007 — 2010)
Date: 2008-04-14 18:53:54 UTC
From: hamaddict2001
Topic: 5100 Message: 5100

Hi there,

I am going to stage a mini dxpedition to a location with a good shot to an Igate. I will have my TH-D7ag with me but no computer. I was wondering if anyone has setup an APRS to DXcluster gateway so that I may forward operating frequencies for our mini dxpedition to the internet DXcluster, and not just the internet APRS data stream.

I imagine someone in the world, somewhere must have setup something like the email server that takes properly formatted APRS messages and forwards them onto the regular internet DXcluster stream.

I know DX cluster info can ride along with the APRS stream and this is NOT what I am interested in. I want to get my spots into the regular internet DX cluster data stream. I do NOT want to receive DX cluster info on my APRS stream, I want to send it.

Thanks in advance for the advice,
Tom-N2YTF

5101. Motorola VP GPS engine

Yahoo group: APRS (2007 — 2010)
Date: 2008-04-15 11:16:47 UTC
From: Bob MacDonnell
Topic: 5101 Message: 5101

Hi;
Have any of you fellows used a Motorola VP GPS engine? They are old technology, discontinued in the 1990s. They were meant for mobile use.

I purchased one locally on eBay and have not found a way to get it to start and get a fix, either with or w/o assistance. It can be initialized with VisualGPS where the option is built into the program to initialize the GPS. Even at that it will put out NMEA strings but without getting a fix.

A typical NMEA output cycle is as follows:
$GPGLL,2706.5537,S,15300.8844,E,,V*20
$GPGSA,A,1,,,,,,,,,,,,,,*1E
$GPGSV,3,1,11,02,16,127,,05,60,328,,10,51,119,,12,52,001,*79
$GPGSV,3,2,11,15,11,036,,18,09,334,,21,26,278,,24,58,240,*7A
$GPGSV,3,3,11,26,10,050,,29,47,206,,30,65,280,,,,*4F
$GPRMC,,V,2706.5537,S,15300.8844,E,,,,11.1,E*4D
$GPVTG,,T,,M,,N,,K*4E
$GPGGA,,2706.5537,S,15300.8844,E,0,00,,19.9,M,-1.6,M,,*5B

All looks okay, considering there is no 'fix' i.e. the unit is not tracking.

The unit 'sees' satellites, and leaves a track for each. The vendor sent me a second unit, one he was bench testing, for comparison. The second unit will not even recognize the correct satellites. It gives satellite numbers and positions, but they don't match those seen by the first unit or a Garmin II+ I've used to compare info. I'm not too concerned about the second unit, however, only curious. Getting the first one to obtain a fix would be gratifying.

Any ideas?

Thanks in advance for whatever comments you may have. (Yes, I should buy a newer unit. But there is no challenge in that! The power consumption alone is enough to justify turfing the unit.)
Bob in Brisbane ve0rdm/vk4bdm

Bob, as you may recall there was a problem with date-rollover in some of the older GPS equipment, I think this hit near 2000 (1998?) and if that Motorola is old enough, it might be affected. I don't remember the details, only that some equipment could be updated and other equipment would never be able to function properly again. If your "old old" GPS is creating imaginary satellites and tracks--perhaps this is the issue and it is simply unusable if it cannot be updated. A little searching on problems with the GPS system should turn up some details for you, which someone at Motorola might be able to confirm.

Aside from that, early 90's vintage equipment might take an hour or longer to initialize after a cold start, versus less than one minute for the new third-generation engines. They really have gotten better.

Find out how you can get spam free email.

Subject: [illinoisdigitalham] 08 Ham-Com Request for Presentations

Ham-Com is being held this year on June 13 & 14 in Plano, TX. The
theme of the event is "Not Your Daddy's Ham Radio!". We would like
to see an emphasis on is new and modern in every area of the hobby.
This can include new features in radios, digital technologies,
updated operating practices, and so on. In years past I've had
several HSMM presentations, however; this year I only have one. I'd
sure like to have a few more.

To submit a presentation for this year's Ham-Com, please visit the
presenters' submission form at:

http://www.hamcom.org/cgi-bin/ccp51/cp-app.cgi?&pg=presenters

Be sure to get your presentations in early. Being able to advertise
presentations well in advance helps drive attendence. Also, last
year we ran out of time slots in the prime presentation hours
several weeks in advance, with a total of 100 hrs of presentations!

For more information on Ham-Com, please visit the Ham-Com web site at
http://www.hamcom.org/. If you have any questions or need more
information, please contact me at n5oom@....

John Beadles, N5OOM

Hi-

I'm in the market to buy a couple of GPS transmitters for use in ham radio for events with my Kenwood D7 and D700. Could I get some opinions on the pros/cons of the Deluo GPS versus the Garmin GPB18-LVC in terms of reliability, ability to pick up weaker signals, and sync up time?

Thanks much!

Deluo GPS is the only brand of GPS I've ever owned.

I hooked mine to a TinyTrak3 and in conjunction with a Radio Shack 202 HT with 5 watts to the coax. I mounted it on a motorcycle and alternated between a 5/8 antenna using a ground wire and the bike frame as a ground plane and a homebrew J-pole fabricated from 300 ohm tv lead.

Both antennas provided almost a flat SWR. I've been from Dallas to Pie Town, New Mexico twice, Dallas to Kansas City three times. And then on a Ford Ranger I used it to go from Dallas to Porland, Oregon and back.

I have no complaints on this unit. I'd buy another one in a heartbeat. I'll be leaving for New Mexico in mid May. You can check the reliability by going to www.aprsworld.org and typing in my call, N7NET-6.

Deluo is a brand, but not really a manufacturer - their current units
are from Polstar and Navisys, and I think the old ones were from
Evermore. Also, most of the manufacturers use one of a handful of
different chipsets, with the SiRFstar III being very popular right now.

I think Garmin has traditionally had their own GPS engines, but their
newest crop have SiRFstar IIIs. This is one of the big differences
between, for example, the GPSmap 60CS and the GPSmap 60CSx.

In my experience, the SiRFstar III is faster to lock and more sensitive,
especially indoors or under heavy tree cover. The big advantage of the
GPS 18 (for some users, anyway) and the main reason I carry it myself is
that they'll work above 60,000 feet, where most others won't. This is a
requirement for high-altitude balloon users.

Also, the GPS 18 is suitable for hard mounting with an M3 bolt, if you
want to put it on a vehicle and make sure it stays put.

I still carry some of Deluo's stuff, but I'd pretty much reached the
limit of what they could give me for quantity discounts and lead times
were unpredictable, so I've started importing directly from Polstar in
Taiwan. My ADS-GM1 is a Polstar SGM-208 (SiRFstar III chipset) with a
DB9 wired for direct connection to a tracker.

Thanks for that. The epoch change rollover may be the problem.

Motorola my not be interested in discussing them anymore but no harm in asking.

I've let them look overnight with a good sky view in a fibreglass boat with no 'fix'. They see satellites quick enough, but can't get located so I expect you are correct.

Thanks for that,

Bob, I don't know which location Motorola handles their GPS units from, but you usually can get an engineer or tech in any of their divisions on the phone. From Brisbane that could get expensive--so I hope you have Skype or another VOIP service. That would keep the call cheap enough, typically under US 5 cents per minute even halfway around the world.

I'm a Garmin fan...I've been using mine GPS-18LVC with TT3 in my car for about 2-3 years. I also use GPS-18PC with my D7 (same GPS just pre-wired). I remember that when I was setting up and testing my TT3 tracker I was doing it in the basement, where my shack was at the time, with just two small windows and I was able to get a GPS lock. Cold and warm start times are both impressive. Enclosure is tough, fade resistant and rated for outdoor installation.

And no, I'm not affiliated with Garmin in any way, I've been using this GPS line for some time now and I never had a reason to look for anything else

Hope this helps

I would take both brands with a grain of salt. Garmin doesn't like to discuss details, they can get a bit paranoid about it. Some users have noted that different Garmins GPSes use different engines, including the SirfStar-III and the new MHL (?? threee letters, begins with M, I'm fuzzy on the next two) engine which apparently performs equally well if not better.

Deluo...sometimes can't tell you what they've used and apparently updates products fairly often without mentioning the internals may have changed. So specific models or revisions can make a huge difference.

Of course Deluo are "just merchants", while Garmin make and spec their own equipment all the way. If I had to bet, I'd bet that Garmin would be around longer, but I confess to owning both.<G>

You may also want to consider Garmin's new GPS18x-LVC. It has the same form factor as the GPS18 but has a more sensitive receiver. It was just released a couple of weeks ago. I have a couple of GPS18 receivers and they've always worked great. I just purchased a GPS18x and it works even better -- it locked, in the house, in about 18 seconds.

I've used a Deluo and although it worked OK I discovered that it had some undesirable RF emissions that caused problems with some other radios I was using. I haven't had any issues like this with Garmin's products.

Assuming the 18x has a SiRFstar III receiver like all of the other 'x' models I've seen, the drawback there is that it won't work above 60,000' elevation. Not a problem for automotive use, but not good for balloons. High-altitude operation is the #1 reason I stock the 18 and 15.

I agree about the Deluo and RFI - I've seen some models put out spurious emissions in the 2-meter band. I'm assuming they've been tested to FCC standards, but I can't recall seeing a sticker on them.

My ADS-GM1's have the sticker, but I didn't take the manufacturer's word for it. I had the Tracker2 and ADS-GM1 tested together and verified as a class B device under FCC Part 15 by an accredited lab. Got CE EMC certification as well.

Anyway, the GPS 18 is a great receiver, and if you don't need high-altitude operation then the 18x is undoubtedly even better.

Not all of the 'x' models use SiRFStar III. The Rino 520/530HCx
series, for example. There is a lot of misinformation web sites about
that. I don't know about all of the 'x' models, but I do know that
the Rino and GPS16/18x don't use it.

Hi all-

I really appreciate all of the inciteful comments about the Deluo GPS vs. the GPS18-LVC. There's a lot of good experience on this list. I went with the GPS18-LVC (have an event coming up so was in a hurry) and if I can find it I'll probably also get a GPS18x. Ability to lock in 18 seconds inside a house sounds pretty cool.

We're going to try an all (only) APRS net for the March of Dimes event here in Fort Collins where each station has a laptop, radio/TNC and a GPS along with the sagwagon plus a couple of walkers and maybe a bicyle mobile ham. This is all in the flat and we will probably try to keep the packets going only a few hops.

Sincerely,

-Steve Henry, N7GN

Just picked up my Alinco DR-135TP MkIII, and plan on setting up for APRS use. I think I can figure out how to append my object symbol ("j" for Jeep)using the LTEXT, but what to-call APxxxx should I use?

And does anybody running one have any programming pointers? Ill be using a DeLuo puck GPSR, plugged into the data jack on the front of the unit.

Thanks much!

73, Chris.

Ray,

I'm not aware of anything that combines all three elements in a single unit - GPS, Radio and TNC. The closest I'm aware of is the MicroTrak put out by Byonics (www.byonics.com <http://www.byonics.com/>) - It's an all in one device - a small transmitter tied to his TinyTrak3 device - all you need to add is a GPS - and you can get a hockey puck style and add to that for a pretty small package.

However...While your idea sounds like a perfect use for this kind of technology - if the dog is separated from your team - are you "legal" with regards to having an operator at the station? Certainly this is something we'd like to see the FCC address.

Just a thought...

http://www.bigredbee.com/blgps_2mhp.htm

I have a unit that might be interesting, but some work would have to
be done in terms of packaging and antenna design. Works great on a
mag-mount in a car, but needs addtional ground plan and shielding for
truly portable operation.

It can also do 70cm, which would make for a more convenient antenna size.

Output power is about 5 watts using 8 volts DC input.

Seriously, there shouldn't be any difference between an APRS weather station that sits unattended on an inanimate hill and one that's riding on the back of a dog.

As for hardware, I'm working on something, RPC Electronics has the RTrak (and is working on a battery-powered version, I believe) and SRB Electronics has one in the works as well. All of them are < 1 watt (except the larger of the projects I'm working on, which will be heavy for a dog). The tricky part is getting a decent antenna on a dog.

As for legal the dog's are under control of the handler so I think I will be ok. I guess if it comes up I can always say the transmissions are emergency in nature for non training actions. Thanks for the info I will look at the byonics site again.

Wouldn't most search dogs have a roughly 19" tail? If you ran a thin insulated wire on the tail, and a counterpoise down a rear leg... a dog excited by the hunt (tail up) should radiate well. :-p

It's funny how I read this thread and legality has to come into the equation. Why is it you can ask a ham any question and it always goes to "Is this legal?". Whether the unit is mounted on a dog, cow, goat, Boeing 757, or the rear bumper of a passing UFO, the unit still has a control op back at home.

Anyway, check Byonics.com. Byon has many very small units that could be adapted to the use you want. Or, if this doesn't have to be an aprs/ham piece of equipment, you could just get into the usual rf unit used for tracking hunting dogs. maybe do a search on google for "hunting dog tracker".

Read this quickly, as it will self destruct in 30 seconds before the fcc reads it too.

From: ka2zev
Topic: 5127 Message: 5127

The guy who suggested a 70cm unit is on the right track.

Smaller waves, smaller antennas.

A simple dipole antenna can be made into most dog collars.

Use of a harness would be even better because it would keep the GPS puck pointing up.

It would hold an electronics package to either the front of the dog, or on its flanks. The front would be better since dogs depend on the size of their head as a gauge to see if spots can be gotten into.

As for radios, Kenwood Years ago had a small 1 watt unit ending in '21' for 2m and I think '41' for UHF.

Today I would use a VX2 or one of the cheap `credit card' units.

300mW should be more than enough for coms at most ski slopes I have looked at. Dogs have a physical limit, and that is better than the handlers. So more than a few miles won't matter.

Batteries have improved over time as well. Modern cells don't weigh as much as the prior generation of NiCad's did.

This whole thing can be built for not a lot of money, nor need it be very heavy. With a little bit of care, I'm willing to bet 24 hours or more of 'run time' can be done.

I would be tempted to `fab up' a prototype for you, but my dog is not suitable. Who ever heard of an 8 lb attack or rescue dog?

http://www.flickr.com/photos/90108848@N00/1296656995/in/set-72157604097892760/

But with a little care I could `hang' a simple APRS unit on my dog, and not have it impede her movements all that much.

The GPS puck would go on the top of the harness, and the radio + batteries can fit on the front.

So fitting something like this to a `real dog' should not be all that hard.

Opinions on this?

Sorry for comming in so late. Thanks for the plug, Scott :o)

I designed the RTrak and we are currently taking orders for another batch of units. The RTrak uses and embedded SMT OT1+ from Scott and a frequency agile 2M transmitter from SRB. The GPS is BUILT-IN. An external GPS unit is not needed. We do include the GPS antenna for the unit. All of this together forms the first true all-in-one APRS tracking unit.

We are also working closely with several dog search and rescue teams in Virginia and a few other states. They are all looking to employ the RTrak to track the dogs. We have several units in the field, being tested and I am awaiting some comments on them. I actually have a unit going to an SAR conference in Virginia, this week to be shown off by a fellow ham, Butch KE4AZL.

For more information, please see:

http://www.rpc-electronics.com/trackers.php

The RTrak is 500-750mW, but most of the SAR guys tell me that is perfect since they are only interested in seeing where the dog is and the dog is never more than about a half mile from them.

I have a couple of groups interested in a high power version and I am willing to work on that, as long as I can get some kind of commitment. If I were to offer the high power unit, it would be to SAR groups only. Since the RTrak is frequency agile, it would be very easy for the SAR groups to move to an alternate frequency, off of the national 144.390 channel.

The Garmin Astro is a very nice doggie tracker. These and other license free units are not APRS compatible, effectively locking you out of digipeater access. As point to point devices they are cool. I wish there were a Ham Radio analog product line to these.

UHF transmitters have high path losses, so you will need about 6 time more power in open air to accomplish the same results of a VHF Transmitter operating at the same power. Searches are rarely open-space, line of sight, affairs, and foliage, fog, snow, etc. only add to the path losses of signals. More power-more better! For VHF, A 12 inch whip antenna is well within the dog's load-factor. Although there are UHF digis out there, they are few and far between. I suggest using the system that has an extant nationwide support infrastructure: The 144.390 network.

Many people are using my Micro-Trak 300 for K9 Tracking, but I recommend the MT-8000 FA. (www.byonics.com/microtrak) The power can be dialed up to 12 Watts at 13.2 volts, or dialed down to a few hundred milliwatts. Having frequency agility extends the operational ranges of SAR teams.

We are working on a hand-held, self-contained frequency agile tracker for SAR teams. The device will have an integrated Siirf GPS receiver, a variable 5 to 8 Watt Transmitter, and a single external control; A SPDT switch to power the unit on in one of two modes. (configuration page 1 or 2 on the Byonics TT3 config software) Power will be provided by field replaceable AA batteries. I will be showing the units at the Byonics booth at the Dayton Ham convention.

The issues of whether a dog, a balloon, ferrets, etc. are permissible operations on APRS are well established, with Riley Hollingsworth of the FCC responding in no uncertain terms that this is a permissible use. Nonetheless, the argument surfaces again and again. If you have a license-its okay. Take a chill pill!

If you can or know someone who builds, How to build what you want (and what you want to use it for) is spelled out in the October 2004 issue of QEX (page 40) A Pocket APRS Transmitter by Barrett, Tony, N7MTZ.

Unfortunately I couldn't find the article online when searching at ARRL.org

QEX magazine October 2004 page 40 is the article A Pocket APRS Transmitter by Tony Barrett, N7MTZ
It describes how to build such a device and actually suggests the use you propose. It doesn't appear to be available online, but perhaps someone can hunt it down for you.

The Pocket APRS transmitter produced by Tony Barrett of High Value Radio, and distributed by Byonics, has been out of production for several years. The Pocket Tracker went extinct due to critical parts becoming obsolete. I designed and manufactured the Micro-Trak 300 to fill the void. The Pocket Tracker was an outstanding product, but you will find the Micro-Trak 300 to be much smaller, more powerful, and just a few clicks away. Byonics has these and much more in stock. www.byonics.com

Actually, you are mixing apples and oranges. The unit Byonics sells that compares to the PocketTracker (our Micro-Trak 300) sells for $95.00 in kit form. I believe this is less than a Pocket Tracker originally sold for 5 years ago. My most advanced model, the Micro-Trak 8000 FA, is frequency agile and capable of operating with as much as 10 Watts of output power. This is the unit that sells for 180.00. For this, you get the equivalent of a portable 10 Watt radio, a TinyTrack 3 controller, and no rf problems, in a package weighing less than two ounces and measuring 1 X 4.7 inches. It is more expensive, I will grant you, but just comparing power output alone, the Micro-Trak 8000 FA is 33 times more powerful.

Topic: 5144 Message: 5144

I am having problems getting my TNC-X to interface with my Alinco DR140.
When I just hook up the TNC to my laptop everything seems fine it
beacons and works as it is supposed to. When I plug in the speaker
cord everything seems fine but no beacon (that I know is normal) when
I just plug in the microphone it seems fine but when I plug in both
cables the radio will key up and transmit.
Here are the Microphone configurations.
tip PTT a copperbraid
Ring is Microphone
Sheild-both common ground and Microphone ground are connected.

Does anyone have a different configuration for this??

Any unit which has NMEA communication (not USB-only).
The Garmin GPSMAP 276C will work with USB for map and program upload
from the computer, and has a serial/NMEA connection for e.g. the TH-D7
(or your boat network, if you have a boat).

About the newest machine you can use that will do this.. is the Garmin StreetPilot 2650.. and its discontinued.

They are still available new-in-box from Frys... www.frys.com they have the entire remaining new stock.

The 2650 has NMEA output capability, but it has to be turned on in the user menu, and USB garmin format has to be turned off in the user menu for this to work as desired. To upload and use maps, serial NMEA is turned off and USB Garmin is turned on.

The 2650 had a direct reckoning functionality that allowed the device to use speedometer inputs and reverse light sensing to determine direction of travel as well as an inertial sensor to detect turns (during travel with bad GPS coverage, such as in tunnels and overhead environments. Its sister unit, the 2610 DOES NOT have DR and DOES NOT have the serial output, so the 2650 is the desired unit of this pair.

Other useable (but used, discontinued units) are the GPS III, III+, V, Streetpilot III, Streetpilot Colormap and older large bodied streetpilot devices. If it has a Round 4 or 5 pole plug or a square (etrex style) plug it should work. The older models (III, III+) do not have updateable basemaps or detailed maps and have limited functionality for displaying NMEA output from the kenwood handheld.

My D700A is motorcycle mounted and the SP2650 showed hundreds of APRS waypoints as they were generated along a charity bike ride I worked last month.

It's not too hard, depending on the level you want.
It could be a simple perl script that does it.

Or

you could run aprsd and just tell it to ignore that you don't have a
tnc, and just configure the netbeacon in it.

The 2650 is an excellent unit - but I believe Fry's may finally be out of them.

A more portable alternative is the 60CSx - a great all-around unit - though the screen is much smaller for use in a car. I take mine on trips when I'm going to rent a car and I use it on my motorcycle routinely.

Loads via USB, has NMEA output, and uses flash memory cards (really TINY ones - microSD) that can hold the entire US plus Topo if you want it to.

Just another option.

From: Scott Miller
Topic: 5151 Message: 5152

A USB port will source more than enough current to run the receiver. Of course, to get data through the USB port you'll need a converter chip.

You can also steal +5v power from the mouse/keyboard port, if the computer has one.

Thanks Scott. I already have a Serial to USB adapter that I will use
to get the data. I wanted to get power for the receiver using the
other USB port that is on my laptop. So this would work out for me.

Subject: [tapr-announce] TAPR/AMSAT BASH at Hamvention

The 2nd annual joint AMSAT/TAPR Hamvention Dinner will be held on Friday evening, May 16, at the Kohler Presidential Banquet Center in Kettering (a suburb just south of Dayton). AMSAT is handling ticket sales this year, and the following is from the AMSAT web site.

Directions to Kohler's will be available at either the TAPR or AMSAT booths.

Time is running short, so make your dinner reservations now!

Reservations are required and must be made by Monday, 12 May 2008.

The price for the Banquet is $25 per person. Tickets can be picked up at the AMSAT booth at Hamvention on Friday, or at the door. Please contact Martha (martha@...) at the AMSAT office for information or call the office to make reservations. You can reach Martha from 10:00 AM to 6:00 PM EDT at (301) 589-6062, or in the US toll free at (888) 322-6728. Presidents Club Gold members should let Martha know if they are planning to attend the banquet.

6:30 PM Doors open and Cash bar is available with Beer, Wine, Liquor and soft drinks.

7:15 PM Buffet Dinner service begins. The Center has a reputation for good food and service. The Banquet will be in the Lincoln or Kennedy room.

MENU
Fresh mixed green salad with assorted dressings
Roast Prime Rib of Beef au jus - carved on site
Marinated Roasted Garlic Rosemary Chicken Breast in lemon butter sauce
Salmon with Newburg sauce
Whipped potatoes
Normandy blended green beans
Fresh fruit bowl
Roll and butter
Coffee/ iced tea/ water
Assorted pies

5155. UIview crashes

Yahoo group: APRS (2007 — 2010)
Date: 2008-05-06 17:55:12 UTC
From: captcurt2000
Topic: 5155 Message: 5155

Greetings:

I'm trying to setup UIView with a GPS for APRS beacon.

When I configure GPS and say OK, the program crashes and says UIView caused a stack overflow in Kernal win32.

Any ideas?

I know the GPS is functioning OK port is good etc since I can use it all with other Programs and GPS utilities into the same port.

Also, since this happened the first time, I can no longer launch AGW PE. It errors out and closes.

Thanks for any suggestions.

Call for Papers--2008 ARRL/TAPR Digital Communications Conference

Technical papers are solicited for presentation at the 27th Annual ARRL
and TAPR Digital Communications Conference to be held September 26-28,
2008 in Chicago, Illinois, http://www.tapr.org/dcc.html
These papers will also be published in the Conference Proceedings
(you do NOT need to attend the conference to have your paper included in the Proceedings).
The submission deadline is July 31, 2008. Please send papers to:

Maty Weinberg
ARRL
225 Main St
Newington, CT 06111

or you can make your submission via e-mail to: maty@...

Papers will be published exactly as submitted and authors will retain
all rights.

Sent: Thursday, May 8, 2008 10:21:30 AM
Subject: [illinoisdigitalham] GO-32 9.6k APRS Sked May 17, ~8:30pm EDT

I'm putting together a little sked for APRS operations on GO-32.
I've been listening, and there doesn't seem to be many hams in the
region using it.

It seems that most folks have seen their own position report, and that
is it. I'd like to see something other than my own packet :).

I'm working with some of my local hams to help them get on, but we'd
love to see some packets from Dayton and elsewhere in the country!
So if you'll be there with your TMD7x0 or TH-D7A(g), and you don't
have anything better to do on a saturday night, set it up for GO-32
and send a few position reports!

Dayton GO-32 Pass

Time	Satellite	Azm	Elv	Mag	Range
2008-05-17 20:34:04	GO-32 [P]	145.5	10.0	10.7	2403
2008-05-17 20:39:11	GO-32 [P]	71.8	50.1	9.0	1029
2008-05-17 20:44:20	GO-32 [P]	357.8	10.1	11.1	2416

Everything you need to know to operate via GO-32:
http://web.usna.navy.mil/~bruninga/GO32-ops.html

I'm trying to line up someone to switch their igate to GO-32's
downlink and run that configuriation for the duratoin, but so far all
my candidates are stuck on 1200bps, my own home station included.

A suggestion is to put the same question to the UI-View yahoo! group.
I think G4IDE (now SK) answered some similar questions some years ago;
they must be in the message archives - anyway, there are lots of
experienced UI-View users in that group.

Topic: 5161 Message: 5161

Hello all, I rode up thru Columbus, MS last Friday, May 16th. I had a good track from Mobile up thru just south of Meridian, MS. I KNOW I was digi'd several times north of there, especially from Brooksville to Columbus, MS (POS showing up on D700A) by the Starksville digi I expect.

See http://aprs.fi/?call=K9FV-1&dt=1210291200&mt=m&z=9&timerange=3600 for a decent track - and use your favorite site for tracking. K9FV-1 is used.

Is anyone surprised I never showed up on any of the Starksville digi's?

Thanks to all for any comments.

5162. Help with APRS

Yahoo group: APRS (2007 — 2010)
Date: 2008-05-12 23:17:41 UTC
From: zl1gbb
Topic: 5162 Message: 5162

Hi
I seem to have a mental block and could do with some help.
Problem I have is with the concept of single frequency repeaters as used by APRS. A dual frequency repeater sends on one frequency and retransmits on another. Receivers never (normally) hear the uplink. If the repeater doesn't pick up and retransmit the message, the user does not hear anything. However, with single frequency repeaters, a delay is inserted (by the digipeater) and then (basically) the same information is retransmitted. Which means the user can hear both transmissions (if they are close enough together). Question. Does the local user system ignore the first transmission and use the information in the second (from the digi) only? OR does it hear and use the information from BOTH transmissions?

I am talking here about stations that are close enough together so both transmissions are heard at the receiver. Obviously, if the sending station was far enough away so only the digi heard it my question does not apply.

I have some 8.2 Firware EPROM's for KPC-3 non-plus.
I can program other EPROM's as well.

See my brand new page at:

http://SolasPrime.com

I'm starting a PC Repair & Custom PC Building
business.

I've been out of work too long, and I got tired of
waiting for the electrical union to find work for me.
My wife just had a baby (kid # 4!), so working from
home might be better.

I wish I could start a 2-way radio shop, but I don't
have the money or equipment for it (like a good
service monitor, swr bridge, or even a watt meter for
VHF. I hope to find an IFR 1200S that isn't selling
for the new price of $5,000.

Cheaper to start out smaller, like PC Repair.

My Kenwood TM-D700a denotes the digipeated (repeated digital signal) as a duplicate beacon, and overwrites the data in its list. NMEA waypoints are updated with the duplicate data. Its really a non-event for the casual receiving station or operator wether they hear the original beacon or a digipeated beacon.

To clarify, what you identify as a dual frequency repeater is considered a Duplex repeater. Receive on one frequency, and simulcast the received signal (usually voice) on the other. A simplex device or conversation uses a single frequency, and in the case of APRS, digital repeaters (digipeaters) receive a packet of information, then retransmit the packet in its entirety after a short delay.

I picked up an HP 8920A on eBay for around $3200, about a month before
Agilent discontinued support. It's not cutting edge, but for anything
up to 1 GHz it works great.

PC repair is easy to get into, but there's lots of competition. I had
my fill of that years ago.

My newest toy - er, capital equipment investment - just showed up today,
a Roland MDX-20 CNC milling machine. It eclipsed the 8920A for the most
expensive single piece of equipment I've got, but at least in theory
it's got more potential for direct revenue generation! Mostly I got it
for prototyping and development, though. At the moment it's running
through a sample file, cutting a banana shape out of machinable wax.
Wish I had time to put together some more display stuff for Dayton with it!

I've already got some samples of acrylic, ABS, Lexan, Delrin, balsa, and so on to try out - the callsign thing had certainly crossed my mind. I'm keeping busy enough with my other endeavors at the moment, though - maybe I'll spin that side-business off to my son. He'll be done with the 6th grade soon, high time to start doing something productive. =]

I may get a chance to use the machine to customize a case for my SSTV camera demo for Dayton. A single circular hole for the camera lens is about all the complexity I want to tackle right now, until I figure out more of the software.

Once I get it cutting PCBs, I've got all sorts of ideas for new APRS stuff I want to try out. The fine trace widths I'm working with just aren't practical for photo resist etching at home (and drilling the boards by hand is a pain) and there's lots of stuff I want to try but haven't been able to justify the cost of a commercial PCB run.

5169. MFJ-1278 troubles

Yahoo group: APRS (2007 — 2010)
Date: 2008-05-13 17:41:23 UTC
From: Matt
Topic: 5169 Message: 5169

I'm needing information about the cable that connects a MFJ-1278 to the computer being used. I have been using mine for APRS and recently found out that the connections I had soldered on the RS-232 connector at the TNC had broke loose. I do have a copy of the manual for the TNC, but I can't figure out how to resolder the connections properly, and can't find my notes from the first time I wired the cable. I've made two attempts to get the
TNC and computer to communicate, but have had no luck. If someone has information on the correct wiring, please let me know. All I need is the basic stuff, such as data to/from the
TNC, external PTT, and carrier detect. Again, I found the ports in the manual but can't get it
right.

Thanks in advance,

Matt, WX4MET

5171. Fill-in Digi Question

Yahoo group: APRS (2007 — 2010)
Date: 2008-05-13 04:04:26 UTC
From: bp_gay
Topic: 5171 Message: 5171

Hello Group,
I have been doing a lot of learning with APRS lately and am setting up a home fill-in Wide1-1 digi with my PK-232. According to this document (http://web.usna.navy.mil/%7Ebruninga/aprs/WIDE1-1settings.txt) I should not setup any hops through other digis because "This is to limit their visibility to only their coverage area and to minimize QRM on surrounding systems." However, I think I have to in order to hit the closest wide Igate digi. For example, I did some playing around tonight and determined that I really need to have at least WIDE2-1 (maybe WIDE1-1) in my path in order to show up on the Internet. Therefore, it looks like that I will need to put that as my path otherwise mobiles driving through will not show up on the Internet. Does that defeat the whole "visibility" issue discussed in the above document or should I add it to my path? It seems to me that if I can not digi the mobiles passing by to the nearest Igate that there is no sense in having a digi. Thanks for helping this newbie out.

5172. Deleting APRS contacts in the APRS folder

Yahoo group: APRS (2007 — 2010)
Date: 2008-05-13 13:48:21 UTC
From: Keith Myers
Topic: 5172 Message: 5172

I understand how to delete contacts in the APRS folder, but I kind of freeked out when the actual folder was gone too, not just the contacts. I want to keep my folder somewhat small so my map screen is obscured by all of the weather stations etc. My question, does the APRS folder come back on the contact screen when I receive the first signal after the old contacts have been deleted. Also, on my 710 if I filter only for mobiles or kenwoods, is that all that will show up in my APRS contact folder ? I have read through past questions in the group and did not see the answer to these questions.

Thanks, Keith w4fla

I was a little sleepy when I posted this last night. After coming back
to this question, I understand that my unproto path has nothing to do
with the unproto path of stations I digipeat. All my station will do
is digipeat their stations if they have WIDE1-1 in their path. Duh.

I guess I do still have a question about why I would not want my digi
station to have anything in its unproto path though. I still don't see
why that would matter. The only way for me to show up on the Internet
is to have a WIDE1-1 or WIDE2-1 path. Maybe I'm missing something?
What do other WIDE1-1 digi stations have for their path?

Thanks,
Brent, KF4JZY

From: Lonnie Kuhn
Topic: 5171 Message: 5175

Brent,
I have a small fill in digi here at my home. I have it set in the uidigi area as wide 1-1 for digipeating the mobile traffic. I have a full blown digi approx 16-20 miles from me, so what my digi picks up from weaker stations sends it on up to that digi. Now in my unproto path I have it set to Wide1-1,Wide2-1. As for me, however, the closest I-Gate is some distance away and requires this amount of hops to make it to that Igate. The shortest hop or hops for you to make it to the digi is ideal. I use a KPC3+ TNC for my fill-in digi....so my settings are as follows.... UIDIGI on wide1-1,ky1-1,trace1-1 and my unproto path is apn391 via wide1-1,wide2-2

Hope this helps.

Thanks Lonnie,
That's what I was thinking. I can make it to my closets digi with the settings I mentioned previously, so I will just leave it at that. I guess the document from Bruninga assumes that a Igate was close to the fill-in and that is why he suggested no path.

From: Lonnie Kuhn
Topic: 5171 Message: 5177

Brent,
That is most likely the case. He most likely figured for a real close IGate, that a no path would suffice, however I had the same problem. Without a path, I wasn't making any igates in my area. I was digi'ng out the wide1-1 weak mobile traffic to the higher profile digi further north of me, but my digi wasn't making the internet at all. I started of with a wide 1-1 path however that didn't make the Igate, so I moved it up to wide1-1,wide2-2 array....that way it is almost guranteed to hit the first I-Gate, and if it doesn't hit the first, it will hit the second. Most of the IGates around here are approx. 50+ miles from my location, so needed the wide2-2 to make the trip.
Good luck with your fill in digi, and look forward to seeing you on the airwaves. 73's

(rest snipped)

Keith,
I think that it would be easier for other APRS users to give you an advice if you told which APRS software you are using.
In the APRS software I am using, there is no "APRS folder" and no folder with contacts.

5179. RPC Electronics as Dayton Hamvention 2008

Yahoo group: APRS (2007 — 2010)
Date: 2008-05-15 02:09:50 UTC
From: Jason Rausch
Topic: 5179 Message: 5179

RPC Electronics will be at the 2008 Dayton Hamvention this weekend along with Argent Data Systems in booths 503-505. We will have RTraks APRS All-In-One trackers on hand for sale along with all of our regular Garmin GPS Cables, Kenwood Cables and tracker interface cables.

For the first time, we are offering a starting line of cables to interface your Garmin GPS receivers to Icom D-Star radios. So far, we have cables for the round four pin models, serial eTrex models (non-color) and Foretrex models with a 3/32" (2.5mm) stereo jack.

We have new and improved serial devices. The SerialStat has been given a redesign for a slimmer look. We will also have out new RS232 patcher adapters. We are offering two versions. One with 0.1" headers for wire wrapping or a solder pad version for permanant adapters. The solder pad version comes with a double-ended DB9 housing.

We have been working on a new HamHUD with a built-in TNC and we will have a prototype on display. We're looking for some good feedback on this design.

We will also be showing a brand new, non APRS/Packet product simply called the Mic Switcher. This is a tiny PIC controlled mic switcher for dual radios and a single microphone. Come by and check it out for more details.

Please drop by and say hi. We can't wait to see old friends and meet new ones. Looking forward to seeing everyone there!

Thanks!
Jason KE4NYV

Hello again
Didn't do too well with the other question so I will try again.

If there are no digipeaters and no Igates within range, will a
standard home base APRS station hear all other stations? If it
doesn't, what will make it do so?

Please help.

All APRS station within hearing range of that standard home base APRS
station (and on the same frequency).

>If it doesn't, what will make it do so?

Given that you think of "all other" being all APRS stations
world-wide: Your station connected to an APRS Internet Server, with a
filter with the range 20000 km.
(I'm not quite sure that you would want that, and your computer will
have a lot of work to do in order to take care of all that traffic)

BTW, an Igate within range wouldn't normally retransmit all stations
heard from the 'net.

Hi Graeme,

A home APRS station WILL hear and decode all APRS stations within direct radio range irrespective of Igates and digipeters.

Further to your earlier question ... Any specific APRS station will generally utilize the data it received LAST irrespective of whether the data was received direct or through a digipeter or Igate.

hope that helps a bit ..

Regards . .Andrew .. VK5EX

```
;Download APRS Server List 12/3/04
;(This works for UI-View32)
;
;The list supports all Tier 2 servers.
;
;This utility allows you to download an updated
;list of APRS servers from an internet site. The
;list you download will automatically replace
;your current list in the UI-View32
;'APRS Server Setup' dialogue.
;
;URL of server list to download defaults to a
;file on SM5NRK's web page. The file is
;automatically created by software on his
;APRS server. Note - you do not need to
;input the "http://" part of the URL, it is
;displayed to the left of the text box, and
;it is automatically added to your input.
;
;Other ServerList sites:
;france.aprs2.net/APRServe2.txt
;serverlist.aprswest.com
;
;When you click the Download button, if
;the download is successfully, then the
;UI-View32 server list will be automatically
;updated. If any problems occur, then an
;error message will be displayed. If the
;downloaded list appears to contain comments,
;then it will be opened in NotePad so you can
;read the comments.
;
;NOTE - Do not use this utility if you have the
;UI-View32 'APRS Server Setup' dialogue open,
;because, when you close the dialogue, the old
;list of servers will overwrite the new list.
;
; This file lists the Tier 2 servers with their filter client ports

Txs Andrew. That's what I wanted to know.

Problem is, my system is not doing that and I don't know why. It does not respond to (on-air) stations UNLESS they have first been repeated. Doesn't seem to matter what path I use (although I suspect that path applies to transmit only). Weird thing is that I have the same problem with both Uiview and AGWtracker. I feel I am missing something very simple. It is very frustrating.

HI again Graeme

Yes your path settings only apply to your own transmissions. Well I cant think of any other good reason why you would only decode stations through a digipeater and not direct with settings changes in either of the two programs you mention. The significant things to look at are signal strength of received stations as compared to the received signal strength of you digipeater. You really do generally need good signal strength for reliable decode .. i.e.. S9 or better . Perhaps your receiver in the radio your using is a bit off frequency and for what ever reason is more tolerant to the digipeaters transmitter than other local stations ... Try using a different radio .. How many local (direct stations) do you think you should receive ? .. are they all strong i.e.. S9 ish ? See how you go

Slightly topical I suppose...I've always wondered how much impact the Doppler effect has on 2m. If I'm moving 65mph one way and the other guy is moving 65 the other way, would it make much difference? I've noticed I can generally pick up fixed stations better than mobile, but I've always chalked that up to PHG more than anything. The more I think about it though, the more I wonder...I'm shoving 50 watts into a 2.6dB antenna that's mounted a good 8 feet off the ground (on the mirror of a Freightliner), I oughtta be getting out really well and sometimes I have trouble with nearby mobiles even on flat terrain. Things that make you go hmmmmm.....

Dan

A quick back of the envelope calculation says you will have a frequency
shift of about 30Hz at 145MHz, so nothing to worry about!

5189. Creative Services Software Expands Radio and TNC Support, Enhances Automation in New Release of PacTerm and PKTerm Amateur Radio Software

Yahoo group: APRS (2007 — 2010)
Date: 2008-05-18 04:51:26 UTC
From: Mark Thompson
Topic: 5189 Message: 5189

Creative Services Software Expands Radio and TNC Support, Enhances Automation in New Release of PacTerm and PKTerm Amateur Radio Software

FOR IMMEDIATE RELEASE: Dayton, Ohio, May 15, 2008?Creative Services Software, Inc. (CSS) will debut a new release of the company's TNC software at the Dayton Amateur Radio Association's Hamvention,?? which gets underway tomorrow at the Hara Arena. Version 3.76.02 of both PacTerm??? (for Timewave/AEA TNCs) and PKTerm??? (for Kantronics TNCs) expands the number of radio transceivers that may be PC-operated through a terminal node controller (TNC), adds flexibility to TNC operation, further automates setup, startup and shutdown procedures, expands support to 2000 Hz in MT 63 mode, and increases file transfer capabilities.

CSS Expands Support for ICOM, Yaesu Transceivers

PacTerm/PKTerm now supports the new ICOM 7700 and four new Yaesu radios, adding the FT-450, FT-950, FT-2000, FT-DX 9000 models. The expanded radio compatibility is in addition to the 66 radios already supported, providing many times greater compatibility than other TNC software solutions.

In addition to new radio support, PKTerm also now supports the new Timewave DSP-232+ TNC. The plug-and-play DSP-232 is Timewave's newest multimode data controller designed around a high-speed digital signal processor. Digital signal processing combined with memory ARQ, true DCD, and hardware HDLC provide advanced signal filtering, modem performance and flexibility.

PacTerm/PKTerm Now Offer Expanded Multitasking Power

PacTerm and PKTerm are already the only available TNC software offering true 32-bit multitasking capability, allowing operators to control radio transmissions and run logging programs, call book programs and any Windows application simultaneously. PacTerm/PKTerm also continues to support dual TNCs, allowing radio amateurs to work in HF and packet modes simultaneously as well as two single port TNCs on different com ports.

?Multitasking is taken for granted in a Windows environment, but many radio amateurs may not realize that most TNC software products were written before 32-bit multitasking was a standard. PacTerm and PKTerm are the only software solutions of their kind that don't restrict the user's ability to work in other applications at the same time.? said Rick Ruhl, CSS president. ?The ability to work in HF and packet modes at the same time gives operators a real advantage in contesting. It's like turbo-charging the sport of radio. And that's not to mention the personal productivity to be gained from keeping an eye on email and other applications while operating radios.?

New Startup and Shutdown Commands Support Continuous Packet BBS Operation

PacTerm/PKTerm Version 3.76.02 adds support for multiple start-up and shut-down commands, allowing Hams to operate Packet, AMTOR and Pactor bulletin board systems from the TNC, even

when the software and your computer are shut down.

TNC Wizard Further Automates Set-Up

In addition to the new and enhanced capabilities of PacTerm and PKTerm, CSS' TNC Wizard has been enhanced to automate soundcard mode setup for the user. The TNC Wizard, included with PacTerm and PKTerm, automatically locates a computer's serial ports and baud rate, making TNC emulation easier to set up and ensures more error-free operation.

File Sharing, Transmission Modes Improved

PacTerm and PKTerm also now support an unlimited buffer for ASCII file transfers, an important enhancement for MARSGRAMS in particular. In addition, MT-63 mode has been updated to support the 2000 Hz spectrum.

PacTerm and PKTerm will be available for purchase in Booth 108-109 at Hamvention. Existing customers who are current maintenance subscribers may download the new release at no charge from the CSS Website, or may pick up an upgrade CD at Hamvention. PacTerm and PKTerm retail for $99 and are available for purchase online at www.cssincorp.com, at many ham radio retailers and through several amateur radio equipment catalogs.

About CSS
CSS is a privately held software and technology consulting company specializing in software connectivity for amateur radio operators; office automation and network management solutions for business; and custom software development for specialized Web and wireless applications.

5190. Micro Amp

Yahoo group: APRS (2007 — 2010)
Date: 2008-05-18 06:57:50 UTC
From: christopherjdunn
Topic: 5190 Message: 5190

Need some help, not sure what to do next. I have a Micro Trak connected to a Micro Amp. When the Amp is connected, I cannot get any packets out (at least I don't see them on the findu website. If I run the Micro Trak by itself, I can get a couple of packets out through a very local gateway, so I believe there just isn't enough power, the reason for the amp. I had a chance today to use a watt meter to check the amp, and sure enough it's putting out about 8 watts. Ok, so I backed it off to about 4 watts, still nothing. What should be the next step in troubleshooting, kind of lost now? Any help would be great.

Chris

I would be checking to see if I could receive the packets via another
FM rig with packet set-up.

Are you using a known good antenna?

Subject: [APRS] Creative Services Software Expands Radio and TNC Support, Enhances Automation in New Release of PacTerm and PKTerm Amateur Radio Software

Creative Services Software Expands Radio and TNC Support, Enhances Automation in New Release of PacTerm and PKTerm Amateur Radio Software

FOR IMMEDIATE RELEASE: Dayton, Ohio, May 15, 2008□Creative Services Software Inc. (CSS) will debut a new release of the company's TNC software at the Dayton Amateur Radio Association's Hamvention,Â® which gets underway tomorrow at the Hara Arena. Version 3.76.02 of both PacTermâ□¢ (for Timewave/AEA TNCs) and PKTermâ□¢ (for Kantronics TNCs) expands the number of radio transceivers that may be PC-operated through a terminal node controller (TNC), adds flexibility to TNC operation, further automates setup startup and shutdown procedures, expands support to 2000 Hz in MT 63 mode, and increases file transfer capabilities.

CSS Expands Support for ICOM, Yaesu Transceivers

PacTerm/PKTerm now supports the new ICOM 7700 and four new Yaesu radios, adding the FT-450, FT-950, FT-2000, FT-DX 9000 models. The expanded radio compatibility is in addition to the 66 radios already supported, providing many times greater compatibility than other TNC software solutions.

In addition to new radio support, PKTerm also now supports the new Timewave DSP-232+ TNC. The plug-and-play DSP-232 is Timewave's newest multimode data controller designed around a high-speed digital signal processor. Digital signal processing combined with memory ARQ, true DCD, and hardware HDLC provide advanced signal filtering, modem performance and flexibility.

PacTerm/PKTerm Now Offer Expanded Multitasking Power

PacTerm and PKTerm are already the only available TNC software offering true 32-bit multitasking capability, allowing operators to control radio transmissions and run logging programs, call book programs and any Windows application simultaneously. PacTerm/PKTerm also continues to support dual

TNCs, allowing radio amateurs to work in HF and packet modes simultaneously as well as two single port TNCs on different com ports.

☐Multitasking is taken for granted in a Windows environment, but many radio amateurs may not realize that most TNC software products were written before 32-bit multitasking was a standard. PacTerm and PKTerm are the only software solutions of their kind that don't restrict the user's ability to work in other applications at the same time.☐ said Rick Ruhl, CSS president. ☐The ability to work in HF and packet modes at the same time gives operators a real advantage in contesting. It's like turbo-charging the sport of radio. And that's not to mention the personal productivity to be gained from keeping an eye on email and other applications while operating radios.☐

New Startup and Shutdown Commands Support Continuous Packet BBS Operation

PacTerm/PKTerm Version 3.76.02 adds support for multiple start-up and shut-down commands, allowing Hams to operate Packet, AMTOR and Pactor bulletin board systems from the TNC, even when the software and your computer are shut down.

TNC Wizard Further Automates Set-Up

In addition to the new and enhanced capabilities of PacTerm and PKTerm, CSS' TNC Wizard has been enhanced to automate soundcard mode setup for the user. The TNC Wizard, included with PacTerm and PKTerm, automatically locates a computer's serial ports and baud rate, making TNC emulation easier to set up and ensures more error-free operation.

File Sharing, Transmission Modes Improved

PacTerm and PKTerm also now support an unlimited buffer for ASCII file transfers, an important enhancement for MARSGRAMS in particular. In addition MT-63 mode has been updated to support the 2000 Hz spectrum.

PacTerm and PKTerm will be available for purchase in Booth 108-109 at Hamvention. Existing customers who are current maintenance subscribers may download the new release at no charge from the CSS Website, or may pick up an upgrade CD at Hamvention. PacTerm and PKTerm retail for $99 and are available for purchase online at www.cssincorp.com, at many ham radio retailers and through several amateur radio equipment catalogs.

Hi Chris

I like using APRS world to track with . I had a lot of problems with my tiny-trac to begin with. I was told to get the antennas (Radio and GPS) as far apart as possible. I keep the whole package of equipment in a plastic gun case in my car. I ended up installing a RF choke on the cable going into the case.

I would be checking to see if I could receive the packets via another
FM rig with packet set-up.

Are you using a known good antenna?

Paul,

I don't see where it has NMEA output - without that - you can't use it. Many (Most?) new GPS's coming out these days don't. Especially ones designed for auto use. The smaller handheld ones more often do.

Creative Services Software Expands Radio and TNC Support, Enhances
Automation in New Release of PacTerm and PKTerm Amateur Radio Software

FOR IMMEDIATE RELEASE: Dayton, Ohio, May 15, 2008-Creative Services Software
Inc. (CSS) will debut a new release of the company's TNC software at the
Dayton Amateur Radio Association's Hamvention,Â® which gets underway
tomorrow at the Hara Arena. Version 3.76.02 of both PacTermâ"¢ (for
Timewave/AEA TNCs) and PKTermâ"¢ (for Kantronics TNCs) expands the number of
radio transceivers that may be PC-operated through a terminal node
controller (TNC), adds flexibility to TNC operation, further automates setup
startup and shutdown procedures, expands support to 2000 Hz in MT 63 mode,
and increases file transfer capabilities.

CSS Expands Support for ICOM, Yaesu Transceivers

PacTerm/PKTerm now supports the new ICOM 7700 and four new Yaesu radios, adding the FT-450, FT-950, FT-2000, FT-DX 9000 models. The expanded radio compatibility is in addition to the 66 radios already supported, providing many times greater compatibility than other TNC software solutions.

In addition to new radio support, PKTerm also now supports the new Timewave DSP-232+ TNC. The plug-and-play DSP-232 is Timewave's newest multimode data controller designed around a high-speed digital signal processor. Digital signal processing combined with memory ARQ, true DCD, and hardware HDLC provide advanced signal filtering, modem performance and flexibility.

PacTerm/PKTerm Now Offer Expanded Multitasking Power

PacTerm and PKTerm are already the only available TNC software offering true 32-bit multitasking capability, allowing operators to control radio transmissions and run logging programs, call book programs and any Windows application simultaneously. PacTerm/PKTerm also continues to support dual TNCs, allowing radio amateurs to work in HF and packet modes simultaneously as well as two single port TNCs on different com ports.

"Multitasking is taken for granted in a Windows environment, but many radio amateurs may not realize that most TNC software products were written before 32-bit multitasking was a standard. PacTerm and PKTerm are the only software solutions of their kind that don't restrict the user's ability to work in other applications at the same time." said Rick Ruhl, CSS president. "The ability to work in HF and packet modes at the same time gives operators a real advantage in contesting. It's like turbo-charging the sport of radio. And that's not to mention the personal productivity to be gained from keeping an eye on email and other applications while operating radios."

New Startup and Shutdown Commands Support Continuous Packet BBS Operation

PacTerm/PKTerm Version 3.76.02 adds support for multiple start-up and shut-down commands, allowing Hams to operate Packet, AMTOR and Pactor bulletin board systems from the TNC, even when the software and your computer are shut down.

TNC Wizard Further Automates Set-Up

In addition to the new and enhanced capabilities of PacTerm and PKTerm, CSS' TNC Wizard has been enhanced to automate soundcard mode setup for the user. The TNC Wizard, included with PacTerm and PKTerm, automatically locates a computer's serial ports and baud rate, making TNC emulation easier to set up and ensures more error-free operation.

File Sharing, Transmission Modes Improved

PacTerm and PKTerm also now support an unlimited buffer for ASCII file transfers, an important enhancement for MARSGRAMS in particular. In addition MT-63 mode has been updated to support the 2000 Hz spectrum.

PacTerm and PKTerm will be available for purchase in Booth 108-109 at Hamvention. Existing customers who are current maintenance subscribers may download the new release at no charge from the CSS Website, or may pick up

an upgrade CD at Hamvention. PacTerm and PKTerm retail for $99 and are available for purchase online at www.cssincorp.com, at many ham radio retailers and through several amateur radio equipment catalogs.

Not sure if you are in the market for a GPS/navigation system or if you already have a TomTom, but if you are shopping, the Garmin Nuvi 350 works works wonderfully with the OpenTracker2. It even shows other stations as waypoints on the screen--it's really cool.

-I am not sure if anyone has discussed the Avmap Geosat 5 with aprs, but look up the avmap g5 on the internet and watch the video on you tube of the g5 and kenwoods aprs radios and you will really be impressed. The g5 is a little expensive, but what it does with aprs is worth it's consideration... I have the Kenwood tm d710a and the G5 and really enjoy it.

All units madde for marine purposes have NMEA. Many of them will also
have street navigation possibilities.

Brent,
How did you configure the Garmin Nuvi 350 for NMEA output? Did you use
the USB port? Did you make the connector yourself or buy one to
connect the Garmin to the OpenTracker?

The OpenTracker2 reads and writes the Garmin data stream--no need for NMEA.
The website for the OpenTracker <http://www.argentdata.com/> sells the
cable<https://www.argentdata.com/catalog/product_info.php?cPath=23_26&products_id=90>to
put the Nuvi into whats called "Fleet Management" mode which plugs
into
the USB port. The Nuvi must be powered by external power in order for this
to work. They also have a pretty active Yahoo
group<http://groups.yahoo.com/group/tracker2/>you may want to check
out. I'm very happy with mine. You can also hook a
regular GPS/NMEA to it if you want. It has many cool features such as
sending APRS messages to it to remotely configure it and sending APRS
messages from the Nuvi itself.

From: Scott Miller
Topic: 5192 Message: 5200

It doesn't do NMEA out. The Tracker2 speaks Garmin binary protocol, which the newer nuvi and StreetPilots can use when the proper cable is plugged in to the USB port. Right now I'm still getting my cables from Garmin, but I'll probably make my own as soon as I find a good source for 5-conductor mini-B cables.

Even cooler: You can send/receive APRS messages using that GPS and
a Tracker2. Better yet: Put a T2-135 TNC board into an Alinco
DR-135T radio, hook up the Nuvi, and you have a 2-unit setup that's
relatively cheap that lets you do all that. The T2-135 is a
Tracker2 TNC that's in a form factor that will bolt inside the
Alinco.

AND the Tracker2 speaks NMEA protocol, for those of us with older
GPS'es. It'll still work that way, you just can't do the Garmin
Fleet management mode and send/receive messages direct from the GPS.

Byon sells the cable for $25 USD plus shipping. Plug and play from GPS
to Kenwood (with power connection as well)

If you MUST roll your own, the pinout for the GPS is the same as the
pinout coming FROM the TT3's serial port intended for GPS. Pin for Pin.
The TT3 and 4 documents including their pinout are available on the website.

If you HAVE a TT3 or 4 you can actually drive the D700/710 with the
tinytrack and get smart beaconing, which the kenwood doesn't have built
in. I believe the 710 has proportional pathing, but not smart beaconing
(corner pegging, velocity variable beaconing). Myself and other
motorcyclists have used that very setup - TT3 to drive the D700 then use
the manual beacon function as needed.

I can vouch on the TT3 from Byron, I got a TM-271 and ordered the data cable option from Kenwood and soldered it in myself. Took all of about 5 minutes. The TT3 works great for smart beacon and the install was a snap.

On another note, isn't kind of a waste to have a D710 and then have to add another TNC on top of the one you already have? Yeah its great to have a radio with a built in TNC but the one D700 that I have is a home unit and the digi for the house as I wanted to have a full duty digi for the home and the 271 is nothing more then a data radio anyhow.
Just a thought but adding a TNC to a radio that already has a TNC is such a waste.

Just my opinion on the matter.

Peter Dakota Summerhawk

I would advise caution on the use of the UHF depending on where you are in the nation. I have seen several of the repeater sets fall on that frequency and it would be advisable to avoid the areas if possible to avoid interference on the repeater pairs.

The D710 does now. Kenwood released a firmware update which includes
the actual Smart Beaconing (TM) algorithm from the HamHUD people.

I think the D700 requires a visit to the factory for a firmware upgrade.
Apparently they learned their lesson with the D710.

I asked that specific question to the Kenwood reps at Dayton and got a resounding "NO!" I think they had answered that question a few times already.

Check out http://www.gpsgate.com/
It doesn't connect to APRS but...

It would be kind of nice if the data can be presented on the same web application like APRS.FI. but not over the air. I noticed that the AIS system is shown. So addign SMS seems reasonable. Perhaps the answer involves flexible filtering?

Best regards,
Fred

I for one would love to see something like this, open standards and free to use, since one can't use ham for any sort of commercial application. I can't use aprs to track a fleet of semi trucks, for example, but doing it over cellular networks would be completely legal (and ethical).

I dunno much about mobile programming, but I don't think it'd be too terribly difficult to write a java applet that listens to the built-in gps of a phone and automagically sends sms to a server somewhere. Or even use http get requests, depending on which is cheaper on your plan.

With 30-something byte messages every 5 minutes, one server could easily handle millions of users if it's got a good solid internet connection. Hmmmmmmm.......

Yep, the D700 is not field upgradable so there's no way new features
will be added to it. Especially not now after the D710 is out.

In Kansas and Missouri: 446.175 primary, 441.175 secondary. The
secondary frequency has no infrastructure and is meant for special
events requiring higher transmission rates such as balloon flights.

5229. Garmin GPS V and THD7AG

Yahoo group: APRS (2007 — 2010)
Date: 2008-05-21 18:34:49 UTC
From: w8aii_aar5th
Topic: 5229 Message: 5229

I've been running a THD7AG and a Garmin GPS V for several years now. In a recent conversation with another APRS user he told me that he can plot APRS stations as way points to his Garmin GPS III+ screen. I would imagine that I can also do the same with my GPS V. Problem is, I can't figure out where in the menus of both the D7 or the GPS V this is done...

Can someone point me to the right menu?

Hi Dan:

And wouldn't be great if that fleet of trucks could look at an electronic map and see the fuel prices for each stop along their route? That would put some consumer clout back in the "free" market for fuel prices I think--they rely on us not knowing where the lowest prices are .

All it takes is an open system standard, and participants--the technology is already there.

I can't speak to the D7A, but on the Garmin you need to enable NMEA
IN/OUT on something like an INTERFACE menu. You also need to have
data in and data out wired through on your cable (which you probably
have already).

Routing by fuel prices already exists; OptiStop has been doing it for quite a while. Most larger truckstop chains put their prices on the web...it's just a matter of opening it up. Go to flyingj.com, their prices are posted right there.

If we have a server collecting fuel price data and serving it up to the world, and gps enabled users pointed towards the cheapest fuel on their route..man we could change a few things. Come to think of it, why not for fourwheelers too?

Methinks it's time to do a little hacking on my home server. My student is driving, I should be sleeping, but this is gonna be too much fun. I think the hard part is gonna be accessing the phone gps...as far as I can tell, each phone does it differently, with weird rules imposed by both manufacturers and carriers. Maybe a PDA with a bluetooth gps and a cell data card would be better? You could then run CoPilot *and* fuel optimization on one itty bitty device. Come to think of it, doesn't copilot do fuel already? Anyone use it?

Oh, dumb q, what's the policy on using SmartBeaconing(R) for commercial apps?

So we need several data streams...users sending text messages to the service with every fuel price they see; gps data streaming from users and getting posted on maps; and vectors to the cheapest fuel around. It'd be truly evil to put routing in there too, but maybe worth it. One could even have the server send back the stations within a certain radius of each user, but thatd raise traffic exponentially.

Kinda looks like this is going waay off the aprs topic...umm...emails anyone?

We have a UHF version of the Micro-Trak 8000 FA (www.byonics.com/microtrak) in the works, but did not know if there was much in the way of 70 CM operation out there. Thanks for the good info!

On the D7 side (at least for the TH-D7G), you need to enable the WAYPOINT feature to feed stations to the GPS. Menu: APRS, Waypoint (2-3)). Default is OFF. Set to the number of digits you want displayed on your GPS. I've been using "9digits NMEA" and works well with my GPS-II+. Lower numbers cut off from the left to right. For instance 9 digit will display KA0AZS-8, 6 digit will display as 0AZS-8 on the GPS.

To avoid filling your waypoint list up, you can also set a max range, outside of which the radio will ignore and not pass to the GPS. APRS, POS LIMIT (2-7), default is OFF, I set it to 10mi for this past weekend at Hamvention.

Hope this helps

Hi Randy...

Tnx for the reply...

Everything you stated is exactly what I have on the D7. Here is a question, in your GPS II+, under the menu "Interface" what setting ar you using? Mine is currently set at "NMEA In/Out" at 4800 baud. There are several other settings available.

Also on the D7 under menu "APRS, 2-2", you have the option of selecting "NMEA", "NMEA96". which are you using? I have mine set on "NMEA". The GPS only allows 4800 baud from what I can tell. I have been unable to change it to anything else...

Also check on the Garmin site to see if there might be a newer
firmware version available for your GPS. It's possible you might
have a version that doesn't have the NMEA-IN waypoint feature. Be
careful about backing up your waypoints/tracks/routes first.

I've done the waypoint-in feature on my GPS-II+ in the same manner,
but using Xastir instead of a D7A. Your GPS-V is much newer than
my II+. Mine's so old it doesn't even have the city database in it,
nor can I add it.

I don't think its that far off. I ran the idea past Bob Bruninga and his comment was that APRS can do this right now and it is the perfect application for it--but to work on a widespread basis, one needs input from many users. And there would be some interpretation as to weather this was a "commercial app"

I use copilot 9--the non-truck version. I knew the truck version did some other things. Was un aware of routing by fuel costs. Off course fj is so widespread, that even with just their info, the interstate travel can be improved (cost of fuel)

I'm not a semi-driver, but volunteer as a large vehicle driver for an elite drum and bugle corps for their summer tours. We travel with 2 semi's, 3-4 tour busses and several larger motorhome-type sleeper trucks with trailers--all diesel. The cost of fuel is killing us too. We drove 12,000miles last summer in about 8 weeks.

I'm pretty sure one could use a parallel server copy of any of the APRS maps to get a first approximation into service. A standard APRS report with an object tag indicating fuel price would work.

Most important to have an open, available system.

How would a person without a computer get the data based upon his current location?

A smart phone for sure would work, but I don't know how many of those are really there.

THere are certainly some small issues to work out in data entry, verification, distribution, etc, but man it would change the face of the fuel "crisis" for sure.

It'd be truly evil to put routing in there too, but maybe worth it.
One could even have the server send back the stations within a certain
radius of each user, but thatd raise traffic exponentially.

"I dunno much about mobile programming, but I don't think it'd be too terribly difficult to write a
java applet that listens to the built-in gps of a phone and automagically sends sms to a server somewhere."

Check out www.mologogo.com, a couple fo gusy did that a couple of years ago. They use the Sprint BOOST prepaid network, which apparently allows unlimited data for $10/month and has inexpensive phones with real GPS onboard.

I'm sure someone who understood Java could write clean code to do the same thing. Or for personal use--redirect the package to your own server, or the APRS systems.

Find out how you can get spam free email.

5243. PDA-based APRS and weather?

Yahoo group: APRS (2007 — 2010)
Date: 2008-05-22 23:16:36 UTC
From: Scott R. Ehrlich
Topic: 5243 Message: 5243

Hello to all:

I have been a licensed ham since 1992 or so, and am always interested in keeping an eye on the weather, especially during the summer, when strong thunderstorms can come into an area.

Some areas of the country (US) don't have good cell phone coverage, text messages don't provide graphical displays of what is happening, and I may not subscribe to a cell service that offers radar on my cell phone, if I even have it with me.

Thus, aprs to the rescue, right?

My vision is to have a PDA of some kind (laptop is too bulky to carry around and be responsible for), radio, and a cable. Ideally, the radio will have a built-in gps. Just two devices. Maybe even a bluetooth connection. If not, cabled. Or, if a radio has a screen and appropriate application to do it all, just one device!

Now, an application to run on the pda to manage the incoming gps location details, along with map data to show geography, along with a way to gain access to current, [near] real-time radar/nexrad images for my area.

Finally, how to know the active frequency/ies in the area, anywhere in the US???

I'd likely have the radio on my belt and pda in-hand. Worst case, I'd have the gps receiver hanging off my belt, too, if it was a separate unit.

What are my options?

I'd get the pda from ebay, unless I can find someone locally who just doesn't care about theirs anymore. I do currently have a Sony Clie TG50, so if something could run on that, it would save the need to get a PDA, assuming the aprs app runs on palmos that old.

The setup would permit me to bring it anywhere in the country/world, though I spend 99.999% of my time in the states. The setup would be portable enough for complete flexibility (well, if indoors, gps signal acquisition might be a bit difficult).

I am OS flexible - Mac, PC, Linux, whatever.

What does the amateur/aprs world offer with respect to the above?

Thanks.

Scott, WY1Z

Greetings Scott,

Use a PDA, what a visionary! I always thought the PDA was a under-appreciated device. Sure a few have inplementeds ome cool things, like PalmAPRS (no longer available/supported) and SmartPalm (TNC interface) but it seems like that is about it.

I have the same dream!

What I have found is that an intermediate piece of hardware is needed. Something that listens to all devices and then relays it to the PDA. The PDA has only one serial port. However, maybe the newer models with Bluetooth or WiFI can address more than one device at a time.

I did see a GPS recently that had satellite radio, MP3 player, weather, traffic, maps(duh), etc. Maybe that is as close as we can get.

Or, maybe the Asus EeePC at a 7" screen running Xastir fits the bill close enough.

BTW, my two favorite apps for the PDA is Planetarium and PocketSatPlus.

Best regards,
Fred

My wm6 pda can talk to 8 bluetooth serial ports, I think thatll be enough. Thinking of interfacing to the j1708 engine bus in the truck too...tell the world my coolant temp and boost pressure while I'm at it.

Speaking of jbus, anyone here know how to talk to it? I seem to remember reading somewhere it's basically rs422...

5247. APRS for public service

Yahoo group: APRS (2007 — 2010)
Date: 2008-05-23 20:22:23 UTC
From: simmoh56
Topic: 5247 Message: 5247

I'm new to APRS, so be gentle with me if I ask something stupid. And forgive me if this has already been posted, but I couldn't find it. We're looking at using APRS for public service events. Ideally, we'd like to see only our operators in such events, so I'm curious as to how to go about accomplishing that. Theoretically, we could just use a decicated frequency for APRS (if that's even allowed), but that would prevent the use of digipeaters for some of our events over wide geographic areas. Yes, we could set up some radios as our own temporary digipeaters, but why reinvent the wheel? Is there any way we can filter out everyone other than our own operators? I can do that with my APRSPoint software (I think), but I'd also like to know what settings or frequencies might be able to do the same thing for each participating radio operator. For disaster preparedness stuff, we'll eventually have to research how to set up our own digipeaters, since the 'established' ones may not be available in a disaster scenario. But for these public service events, it would be much easier to use the established digipeaters, if we can figure out how not to be flooded with contacts that are not part of the event.

It's certainly allowed, and it's done very often.

> prevent the use of digipeaters for some of our events over wide
> geographic areas. Yes, we could set up some radios as our own temporary
> digipeaters, but why reinvent the wheel? Is there any way we can filter

In theory, normal APRS stations are supposed to display only those stations with TOCALLs starting with AP or GP, I think. You're supposed to be able to change that to allow just that sort of filtering. In practice, I'm not sure how many trackers support that, or how many clients will do the filtering.

If you're connecting to the Internet stream, you can set filter parameters to include only a specified list of stations. Some APRS clients should have filtering capabilities of their own.

One more thing no one mentioned. Menu 2-3 "Waypoint" must be set to
something other than OFF. You will have to experiment with it as the
choice depends on the firmware of the GPS but one of the options
(other than OFF) will work with your GPS. If it's set to OFF, you
won't get waypoints.

With Xastir we set a tactical call for each station we're interested
in, then turn on the switch that says something like "Show only
Tactical Calls". That makes everybody else disappear. I don't know
if other APRS software has a similar type of feature.

> Theoretically, we could just use a
> decicated frequency for APRS (if that's even allowed),

Sure. You can choose your own frequency as long as it doesn't
interfere with existing users. There should be several simplex
frequencies to choose from in your area that aren't being used.

> but that would
> prevent the use of digipeaters for some of our events over wide
> geographic areas.

Correct, so you might as well stay on the main APRS freq.

Aprspoint has the same thing for filtering out what you don't want to see. Been talking to nws to try to use aprs for spotting so we know where everyone is without having to guess on county roads.

From: Randy Allen <ka0azs@...>

On the D7 side (at least for the TH-D7G), you need to enable the WAYPOINT feature to feed stations to the GPS. Menu: APRS, Waypoint (2-3)). Default is OFF. Set to the number of digits you want displayed on your GPS. I've been using "9digits NMEA" and works well with my GPS-II+. Lower numbers cut off from the left to right. For instance 9 digit will display KA0AZS-8, 6 digit will display as 0AZS-8 on the GPS.

On a related subject, just a quick poll - who would be interested in an
NMEA adapter for newer Garmin nuvi and StreetPilot models?

I just got the first prototype working earlier today. It's output-only
at the moment, but tomorrow I'll be working on support for $GPWPL input
(D7, D700, OT1+, TT4, etc) and $PKWDWPL (Kenwood D710) for waypoint display.

Keep me posted on this..

I work with several of the Multiple Sclerosis society MS150/BikeMS bicycle rides, and we extensively use HAM and APRS for operations during these two day 150-200 mile bicycle rides.

With dozens upon dozens of support vehicles, something that would allow newer USB GPS's to be interfaced would be a refreshing option.

5259. New Products

Yahoo group: APRS (2007 — 2010)
Date: 2008-05-26 14:13:49 UTC
From: vhsproducts
Topic: 5259 Message: 5259

I attended the Dayton Hamvention with Byonics last week, and our booth was always busy! I was showing two new prototypes of Micro-Trak products. The first one is called the Micro-Trak AIO (all-in-one) which has an 8 Watt, frequency agile transmitter and a built in SirF III GPS in a waterproof case (I suppose its always safer to say "water resistant: isn't it?) Power is an 8 pack of AA batteries. The case has an O-ring sealed SMA connector, and the only control is under the water tight door. This unit is designed for SAR teams and others that want a one stop tracker. In fact, we will be offering this device pre-programmed with the customers call sign, etc. (You will of course be able to program it yourself if you wish) The case is a Pelican Micro-Case, about the size of a hand-talkie, and built for abuse. I will post photos soon, and expect to be shipping by mid June.

The second product we showed was a Micro-Trak based on the TinyTrak 4 controller. This device will allow you to send and receive tracking information, and display it on your PC, our compatible GPS display receiver. Byon is also working hard right now on developing digipeater firmware for this unit.

Byon is adding a liquid crystal display and a PS/2 keyboard to the TT4, which I will incorporate into the TT4/Micro-Trak. This will allow APRS messaging, packet capabilities, and other features, such as displaying the range and bearing to other stations. (aircraft people are going to love this!) The unit will be a single channel, 1/2 Watt transceiver.

73,

Allen

5262. APRS Identification?

Yahoo group: APRS (2007 — 2010)
Date: 2008-05-26 22:37:27 UTC
From: Carl F Rimmer
Topic: 5262 Message: 5262

I have been noticing lately APRS signals with other then ham call signs, e.g., N4775N, the registration number of an aircraft. These are not objects but live APRS beacons on 144.390. I have traced this particular aircraft to a Technician class licensee in the Cleveland area.

My question: Aren't all APRS beacons to have a amateur call somewhere within the packet such as the comments or status text, if it is not the SSID of the packet? I thought all transmissions are to be identified. This is not the only case. I have seen ships out on the lake, etc. When I generate an object, my call is attached to it. I need some clarity on this matter.

BTW, I had the absolute pleasure today of talking with Bob, WA4APR as he traversed my area. I saw his APRS symbol on UI-View, and just happened to be monitoring a repeater that he was, in fact, communicating on with N8PK, Pat. We talked briefly and I now see him and Pat together on I-76 in PA. Bob, I am hoping we can get people in this area of Ohio to bring there digis and the use of APRS up-to-date with most of the rest of the APRS community.

73 all,

Carl W8KRF

As I understand it, Part 97 only requires that you ID - not that you ID within the packet. They could be IDing on CW, though it looks like it's a TT3, and I don't recall that being a feature.

You can also ID with a direct path, but have the posit go through a
longer path. I'm not saying that's a good idea ('cuz it's not very
gentleman-like), but it's legal.

You have to identify each *transmitter* every 10 minutes in the U.S.
Some send a status packet with their callsign every XX position
packets. This is fine as long as they end up identifying at least
every 10 minutes. Whether they identify using morse code and
whether they use the same path as their position packets (or no path
at all) doesn't matter.

Gentlemen,

I spoke to the owner of that aircraft and he has already remedied his error. Many aircraft people are using APRS, and many are brand new hams, so thanks for your patience!

I have APRSPoint, but haven't gotten familiar to the point that I can make that happen. The filters should be easy enough (I hope), but what to put into the radios, and where, is something I'm totally unfamiliar with.

By the way, thanks for all the replies.

5269. APRS Messages from Internet??

From: bp_gay
Topic: 5269 Message: 5269

Hi group,
Are there any websites setup so a person can send an APRS message to a station that is being tracked from the Internet? Or can this only be done with local programs such as UI-View?

Thanks in advance,
Brent, KF4JZY

5270. Re: APRS Messages from Internet??

I'll be interested in this response also Brent, I have played around with this some, but it seems getting msgs passed to mobiles from the internet, OR even from another mobile radio that has to go thru the internet is difficult. I don't remember the details, but seems like it is something to do with the way Igates are configured.

I did get sending emails from my mobile to the internet to work - even multi-line emails.

I will be watching this thread.

I can't speak for all radios or software packages, but my book for the TM-D710A says you can go from radio to internet via IGate, but not from internet to radio. However, if you have the ability to hook your PC to your radio, messages can be sent that way locally, just not over the internet. I presume this is because radios don't have valid e-mail addresses and IGates don't have mail servers, but that's just a guess on my part.

Ken,
Do you have a document or website that shows how to send emails from the tracker? I have an Opentracker2 hooked to my Garmin Nuvi and I can send messages from the Nuvi using the touchscreen. It would be useful in some circumstances to be able to send to an email address. Thanks.

From the Nuvi, it should look like this:

-email scott@... This is a test.

The '-' tells it a destination address follows. 'email' is the address
of the email gateway, and it expects the email address to be the first
thing in the message.

Brent, I will have to go back and check to see what I can find. It's pretty involved, not hard, just have to follow exact steps.... not something you'd wish to use a lot, but fun to play with.

It will take me a few days to find - *IF* I can find it.

RF to Internet should always work, as long as someone is close enough
to pass your packets to the Inet.

Internet to RF isn't supported by many igate programs, and if it is,
it will only pass messages from people/igates that are logged in using
a proper user/pass. And then it will normally only pass packets to
people that it hears directly on RF (so you have to be really close)

Thanks for all the good info guys:

Scott--That worked as you described. I sent a test message using the Nuvi to my Internet email account and I received it. That is cool. The only thing is that it kept sending so I had to delete my outbox (known issue). The message I received is below:

ksproul [aatt] rci.rutgers.edu to me (I replaced the @ symbol)
>
> this is a test
>
> -------------------------
> Message received by MacAPRS IGate station WU2Z
> Located in NO BRUNSWICK, NJ
> APRS path = KF4JZY-9>APOT2A,WIDE1-1*,WIDE2-2,qAo,WD4ROJ-1

Interesting how the message got onto the Internet from NJ while I'm in Florida.

Ken--Scott assisted me with sending an email with the setup I have, so I am in business. Thanks for your efforts. Also, thanks for the link to that website. When I get a little more time I will have to check it out more deeply.

Patrick--I see what you are saying about the issues involved with Internet to RF. Thanks for the info.

Brent, KF4JZY

Brent, you can also see messages sent from you (or to you) at this link:

http://www.findu.com/cgi-bin/find.cgi?call=KF4JZY-*

then click on the blue ** under "msg".

You can access the messages sent to any other APRS stations near you by clicking here:

http://www.findu.com/cgi-bin/near.cgi?call=KF4JZY-9

simply change the callsign on either of these two links to locate information for any other APRS station in the world.

Have fun!

Yahoo group: APRS (2007 — 2010)
Date: 2008-05-28 21:31:57 UTC
From: Catherine
Topic: 5281 Message: 5281

Hey group,

I am in need of some advanced Elmering.

My goal is to set up a mobile tracker/trackee APRS station for use during public events like bicycle fundraisers and also, a system that I could use to experiment with other digital radio modes.

The equipment I have right now is...

RADIOS
Yaesu FTM-10R Mobile dual band
Yaesu VX-3r HT Dual band
Rat Shack P97 Scanner

OTHER
Dell XPS M1210 laptop (Vista/Linux)
DeLorme LT-40 USB GPS receiver
USB Serial adapter for lappy (no serial)
HTC Tilt (Kiaser) internet teather phone

SILLY ASSUMPTIONS
In a perfect world I could plug in the laptop GPS receiver, install some magic software and then plug in a cable to my FTM-10R and everything would work just the way I want. I would BE a APRS beacon AND tracking station while carring on normal voice communications on the UHF/VHF channel of my choice.

I think the magic software is where this plan falls apart. That software would need to somehow grab the GPS data and feed it to the Radio mic input via some sort of software TNC emulator whilst listineng to the radios output on the packet channel for updates from other stations and taking a break from all that to monitor the voice channel for phone traffic. There are at least ten details that I thought of while writing that that I decided to leave out because I really have no idea what I'm talking about in the first place.

TIA!

A cheap and easy tracking solution would be a TinyTrak (you wouldn't need the laptop), but that wouldn't allow you to explore other digital modes.

http://www.byonics.com/

However, a USB GPS won't work with the TinyTrak. But they have GPSs cheap too.

If you want to be able to also explore more digital, I'd check out the TNC-X.

I think you should give some serious consideration to the TinyTrak 4, since it is bi-directional, and since it does not use a 1200 Baud modem chip on board. This will allow you to decode and send almost anything digital.

A cheap and easy tracking solution would be a TinyTrak (you wouldn't
need the laptop), but that wouldn't allow you to explore other
digital modes.

http://www.byonics.com/

However, a USB GPS won't work with the TinyTrak. But they have GPSs
cheap too.

If you want to be able to also explore more digital, I'd check out
the TNC-X.

Or the Tracker2, which does a lot more stuff, including support for Garmin binary mode. The OpenTracker+ is similar to the TinyTrak4 in capabilities, but a lot cheaper. www.argentdata.com/catalog

For a laptop-only solution, you could use AGWPE and a bit of extra hardware (you can get off-the-shelf sound card interfaces) to hook up the radio.

The only real challenge in any of these setups is the simultaneous voice/data stuff. That really depends on how you want to use the two together.

Yes, the tracker2 would be an excellent choice as well!

I second (maybe 3rd) the OpenTracker2. I am amazed at all the things it can do. I have it hooked up to my Garmin Nuvi 350 and it is sweet! I can even send emails from it.

The Tracker2 is amazing! I saw the demo using a Nuvi in Dayton and I was blown away! The original requestor had asked about a system that would support other modes, and I believe that the Tracker2 is a dedicated 1200 baud system(?), leading me to think that he might prefer the TinyTrak 4 for his uses. I have a T2-135 that I plan on using as my own portable digi, and think its the coolest thing since sliced bread!

It'll transmit 300 baud and PSK31, but it'll only receive 1200 baud. As for additional modes on the TT4, as far as I know nothing else has been implemented yet, but I could be wrong.

My LPC2387 development board shipped yesterday, so I hope to get back to working on my own next-generation TNC before long! A 32-bit, 80 MIPS device is going to be one heck of a step up from the 8-bit processors I've been using.

A laptop is hard to beat for multimode support. They can just be a little unwieldy.

From: Peter Dakota Summerhawk
Topic: 5281 Message: 5290

Depends on what you plan to use on the laptop. APRSPoint will not work with the tracker2 and I don't know if it will work with the TT2/3/4 either. Been looking at several options for this so be careful on your program choice on the laptop before purchasing it.

Just some advice.

To: APRS@yahoogroups.com
Subject: [APRS] Wanted: Super Elmer

Hey group,

I am in need of some advanced Elmering.

My goal is to set up a mobile tracker/trackee APRS station for use during public events like bicycle fundraisers and also, a system that I could use to experiment with other digital radio modes.

The equipment I have right now is...

RADIOS
Yaesu FTM-10R Mobile dual band
Yaesu VX-3r HT Dual band
Rat Shack P97 Scanner

OTHER
Dell XPS M1210 laptop (Vista/Linux)
DeLorme LT-40 USB GPS receiver
USB Serial adapter for lappy (no serial)
HTC Tilt (Kiaser) internet teather phone

SILLY ASSUMPTIONS
In a perfect world I could plug in the laptop GPS receiver, install some magic software and then plug in a cable to my FTM-10R and everything would work just the way I want. I would BE a APRS beacon AND tracking station while carring on normal voice communications on the UHF/VHF channel of my choice.

I think the magic software is where this plan falls apart. That software would need to somehow grab the GPS data and feed it to the Radio mic input via some sort of software TNC emulator whilst listineng to the radios output on the packet channel for updates from

other stations and taking a break from all that to monitor the voice channel for phone traffic. There are at least ten details that I thought of while writing that that I decided to leave out because I really have no idea what I'm talking about in the first place.

TIA!

APRSPoint works with the TinyTrak3 Plus, so I assume it would work with
the TinyTrak4.

You should also look at the Elcom uTNT units. They can be found at
the web site mentioned below.

Some models have the GPS built in, one less cable to contend with.

There is also some with Bluetooth capability. No wires to your
computer.

They also now support some weather stations.

KE5PWX,
As you can see, there are a ton of options and not a "silver bullet" solution to what you are wanting to accomplish. However, that is what makes it fun!! So I encourage you to experiment with the options mentioned here and maybe even come up with some creative solutions on your own and share them with us. I'm sure you will find a way to accomplish what you are wanting done. Also, check out some of the clubs around your area; they could be extremely helpful in elmering you. I checked the arrl.org website for clubs within 20 miles of your zip code and it pulled up Kendall ARS and Intertie, Inc. They both list their specialties as including digital modes, so they may be able to help out even further than what we can do over the reflector. Let us know what you come up with and most importantly have fun doing it.

Paulus, If I understand, by using this format I can send a msg from my radio to an email address?

You say there should be 9 characters? That is the 5 characters in the word *EMAIL*, then the 4 spaces, then the colon? Then the email address. I will try that tonight and see how it works.

There is also a way to send multi-line email msgs but that is a bit more complex - but it does work. I just don't remember the details now.

Yes, there are several apealing options. I think my biggest obsticle at this point is cabeling. It seems like Yaesu went out of their way to make the FTM-10R an isloated device. There is no data port and the mic connector is an odd 7pin micro connector type. There are audio jacks for in and out but they are to support PA type functions (MP3 Player in, PA out...) They sell a raw ended mic cable so I guess I could make my own cable but that would make it a dedicated unit.

The VX3R is not much better (It DOES have a 4 conductor Mic/Headset jack) but I am afraid that 1.5w would not be of much use.

Thanks ALL for the good good advice, I will finish up researching all of it and make a move in a direction soon.

From: wsixgq
Topic: 5296 Message: 5296

Hey everyone, I bought the Kenwood TM-D710A and I am wanting to get APRS up and running.

I have a Magellan Triton 200 I want to use for the APRS.

I do not know the pinout for the Magellan and I cannot find it off the net. I have contacted Magellan with no help yet.

Anyone know what the pinout is for the Triton Series GPS

For bicycle ..... Kenwood TH-D7 with a Garmin eTrex Legend. Get the data cable with integrated data cable to extend the run time. Use the LONG whip on the TH-D7 and run it at either 2.5 or 5 watts as necessary. Works great. Mine is in the pocket of my Handle Bar bag. Need power? Add a brick amp.

For the 'HOME' station, I use a IBM Thinkpad laptop with WinAPRS running connected to a KPC3 or a TinyTrak4. The TT4 is only 60 bucks, pretty cheap but any TNC will work.

I use Older IBM ThinkPad laptops cause they are rugged and not very large. Easy to repair too.

The Triton 200, 300, 400, 500, 1500 and 2000 all use the same cable, so
you might try finding the pinouts for one of the other models.

There are NMEA cables available for the Tritons.

5299. FS: KPC-3+, Garmin eMap and accessories

Yahoo group: APRS (2007 — 2010)
Date: 2008-05-30 21:24:04 UTC
From: w0rmt
Topic: 5299 Message: 5299

Greetings all-

I have a couple of things for sale:

-KPC-3+ TNC v8.3 firmware (hardware serial port model) with y-cable (for radio and GPS connection to one serial port), manual, and v8.3 supplement document. $115 plus shipping costs.

-Garmin eMap mapping gps with computer cable, D7/D700 cable, and a third cable that has both a cigarette lighter powere connection and DB-9. Also included is a heavy duty RAM mount for this particular GPS. $110 plus shipping costs.

Both of these items were used in my mobile APRS setup for about 5 years and are very clean and in great working condition. Further details and pictures can be seen in the respective advertisements in the classified section of qrz.com. I prefer payment via postal money order.

Please email with any questions.

I am using WINAPRS 2.8.5 on an old windows 98 laptop. Have not used this program for a long time. I can see myself on the map but no one else, any where. I am using the KAM KPC 3+ tnc. I can see myself on the internet on another computer using findu.com, so I know I have the tx portion setup right. There fore I believe I have the rx setup wrong. I can see the rcv light come on for other traffic being sent by other stations, but no stations being shown on the map. Anyone willing to help this old man setup the receive portion? Email me direct not on the reflector. Thank you.

i had that problem once. make sure that "mon on" is selected so that your TNC will monitor and display received stations.

just go into the terminal screen and type "mon on" and see how that works.

Hi Guys

Despite my proposed World Wide APRS HF Net apparently not generating much interest, several friends and I are launching it on 3rd June 2008.
Setup is detailed on my web site www.bandscommunications.co.uk under the ‘aprs hf net’ tab. If you would like to be kept informed of progress please email me and I’ll put you on the mailing list.

Hi I am real new to APRS and I am having a few problems setting up my tt3 combo setup.

I live in Columbus Ohio and would be real grateful for any help that anyone might be able to give me.

What I am looking for is the settings and such for Columbus Ohio and such.

If anyone has any suggestions please contact me.

From: Rusty Bryant
Topic: 5300 Message: 5306

I would add "mon on" in the startup string that way when you start up the program it will automatically turn it on.

By default it should be on, but sometimes other programs will turn it off. Airmail turns mine off so i have that plugged into my start up string and it has worked just fine since.

Glad I could help!

Thank you Rusty. Just got it backup and running. It

worked.

Go to the findu.com cgi list, there's a wapfind.cgi that works on mobile. I ended up doing a page on my server that makes it all pretty, alas my call is hard-coded into everything. The individual maps are also viewable on wm6, learn the cgis and you can use them.

One problem I could see using this with the D700 is that the GPS data
and Mic ports are on the main body of the radio not the control head.

In both of our (wife and mine) installations, the radio body is mounted
under the back seat, not really conducive to good GPS lock. It would
need provision for an external/remoted GPS antenna to work in my
particular situation.

YMMV of course depending on how your radio body is mounted.

That's a pretty cool device but you don't get the GPS display that would would get with an Avmap Geosat 5, for example. Yes, you could use your laptop but that's not always convenient in a car!

Not sure I agree -- I have played around a LOT with the new SiRFstar III GPS modules -- they lock just about anyway -- upside-down, under the seat -- even underneath the car. Sure-- would be nice to have it near the window -- but mine is currenty jammed in the seat pocket behind the passenger seat.

I don't have any experience with the SiRFstar stuff. I'm using older Garmins (II+, StreetPilot, etc). I'd certainly like to hear about it if any one plays with one of these on a D700, particularly if mounted under a vehicle seat or in a trunk.

If it performs as you say, then this would be a neat addition to the D700 as well (My wife has never been particularly fond of having a GPS mounted on her dash).

I am using a SiRFstar based GPS receiver in my new Micro-Trak all-in-one devices. I was concerned that the flat panel antenna on the GPS receiver would limit the orientation of the device, but I also found them to be incredibly sensitive. My units will usually lock up inside buildings, sitting on the floor boards of my car, and even under the car. For a vehicle install, I would still follow the best-practice of placing it in full view of the sky.

If one only wants to put out a signal that can be tracked on UI view or what ever other APRS based medium, has no one looked at the Deluo Pro GPS unit. It looks like a gps external antenna, maybe a little smaller and has a long cord that can be run under your dash to under to your radio head in the 700 or 710. I have one that I use with my THd7g and have it in the corner of my dash where you can not even notice most of the time. I use an AVmap Geosat 5 with my TM710A but that is where I am able to see other aprs stations on my G5 as well as putting out my APRS signal.

I know the G5 is quite expensive. It all depends how much you want to get into APRS in the hobby

Sorry to bother all of you with my rambling on

I think that the GPS itself should be mounted where sattelite signals
are good, and the NMEA cable to the D700 radio unit could be even a
couple of meters long (in my boat, the NMEA cable from the GPS
position to the VHF radio is 3,5 m long). If the GPS port of the 710
is different from the 700 one, it would be necessary to build a
special connector.

I do not know about using it on the D700? The same guy sells extension cables, custom lengths. So I guess it is possible.?

I have a 2007 Jeep Wrangler with the MYGIG stereo, http://www.jeep.com/en/owners/mygig/ This stereo has a 20 gig hard drive, DVD player, and Navigation system. That is why i elected to use this "piggyback" system. I dont need another GPS system with a display since the stock stereo has it built in. At this time I do not know if I can "splice" into the wiring of the MYGIG and find the data wires to work with the 710? The pinout that I have available shows nothing for the NAV system. http://mofv.com/mygig/MyGIGPinouts.htm

I sent an email the GPS-710 builder and here is his reply,

"It could definitely be *made* to work, but it loses much of the "built in" advantage when it's used with a D710. The D700 has a different cable configuration, so using a GPS-710 on a D700 would require an adapter just to get power. Also, the GPS attaches to the TX/RX base on the D700, so if you mount the base under the seat or in the trunk you need longer serial and power connectors. For the D700, I'd point people
toward the Deulo unit:
(http://www.deluoelectronics.com/category/44-APRS_GPS) since it has better attachments for the D700."

I agree! I own both the G4T and the G5 and I wish I had another G5. Yes they cost a little more, but I didn't have to buy, or build something to make it work. It is just plug and go. Second, I want to see other Hams on my screen, with the G5, not only do I see them, but I see their "icon" they have selected. The biggest reason I will always stay with Avmap is Customer Service! You will not find a company that will go the extra mile like Avmap to make sure your G5 works with you Kenwood. Don Arnold is the BEST there is in customer service.

This is something that the Tracker2 has done (with Garmin and Magellan units) for about two years now. At Dayton in 2006 I tried to talk AvMap into considering exactly this sort of interface, with the ability to change symbols and add comment text, but they didn't seem too interested and said adding symbols would be too difficult. I guess Don got them to reconsider. Still no comment text, apparently - or at least the D710 doesn't put any out.

Has anyone checked to see if the D710 properly translates TOCALL (e.g., GPSxx) symbols into the proper format for the AvMap?

The nuvi 350 is still my favorite APRS GPS unit for now, but the AvMap's big screen is nice.

5327. Looking for digital not voice 2-meter receiver for APRS

Yahoo group: APRS (2007 — 2010)
Date: 2008-06-05 13:54:14 UTC
From: usna71
Topic: 5327 Message: 5327

Hello, I am looking for some help reducing the wire nest and complexity of APRS receiving stations. My goal is to have a laptop and a single box with power cable, connection to laptop, and 2-meter antenna. Ideally the receiver is optimized for digital signals and frequency programmed by the laptop. No knobs or selections.

Does anyone know of such a rig. If not, is there a nice little 2-meter digital receiver that I can strap to a TNC such as a Tracker2?

thanks,
Bill

5330. Nomenclature?

Yahoo group: APRS (2007 — 2010)
Date: 2008-06-05 20:16:58 UTC
From: Jackson, Anthony
Topic: 5330 Message: 5330

Is there any standardized taxonomy for APRS?

For instance, when we say "tracker" or "tracking station" do we mean a station that is tracking or a station that is being tracked?

I would think we would want to keep it simple and just say transmitter or receiver unless the station was both then you could say it was an "APRS transceiver"

Using that convention (since I don't know any better) does the carrier of an APRS transmitter need an Armature Radio License?

I other words, If I am at a dune buggy race and I want to track the participants, can I give them all transmitters if they don't have licenses?

[Non-text portions of this message have been removed]

Accepted usage for years (at least as far as I know) is that the term "tracker" is a shortened form of "dumb tracker": i.e. one that reports it's position but does not accept incoming messages or display APRS information. Some units (such as the TinyTrak and probably others) do use a transceiver as they do a Carrier Detect to ensure the frequency is not in use prior to transmitting.

I've never heard anybody use "tracking station" in this context, but would assume it would be a "full up" station capable of sending out and receiving and displaying APRS information.
>

Of course, to be really pedantic, my TinyTrak based trackers all have transceivers as they do a carrier detect, but are not able to receive and display data.

For APRS purposes all we really care about is the data, we don't really care what kind of RF device our station is hooked up to (if any, such as internet only stations), My APRS+SA has the capability to send and receive data through an internet connection without a radio involved. By your definition it would be an "APRS Transceiver", which would be misleading as "transceiver" has an RF connotation when speaking to hams.

So we have trackers, display only, and what I normally call "full up" APRS stations (fixed or mobile, RF or internet).

THAT is a can of worms that has been opened many times on the various APRS reflectors. All amateur transmitters have to be under the control of an licensed operator. It depends on how narrowly you define the phrase "under the control of".

Some feel that a licensed amateur would have to be in the vehicle to be able to monitor and turn off the radio if neccessary.

Others feel that as long as a licensed amateur can get to the radio in a "reasonable" amount of time (another can of worms defining that one), either by meeting up with the vehicle being tracked, or by contacting a vehicle occupant through cell or other comms and instructing them on how to turn off a malfunctioning radio, then you are covered.

Of course, you could use a TM-D700 or 710 in each vehicle and use Kenwood's DTMF remote control function of the TH-D7 to command them over a UHF link. That would get a little pricey.

Every once in a while someone says "lets just ask the FCC". During one of those discussions (I think it was on the TAPR sig) someone stated that informally, sources in the FCC has said "no one is complaining right now, there are no documented problems at our level, don't ask the question because you may not like the answer".

My recommendation is to do what you feel comfortable with under your reading of the rules, have a plan to control the transmitters in the trackers if need be, and be able to justify why you did it that way based on an interpretation of the rules.

There's a slight bit more to the above viewpoint.

The "slight bit more" is that you can't have any user-accessible
controls that would affect the operation of the transmitter, other
than the ON/OFF switch. If the radio can be "locked" to prevent
non-amateur tinkering, perhaps that's enough.

Some people put the entire tracker in a case with only an ON/OFF
switch accessible by non-hams. In this configuration the control
operator can ask a non-amateur to turn it OFF. The transmitter is
not under the direct control of the non-ham, so you can also ask
them to turn the package ON: The transmitter timing is controlled
by the APRS TNC so the non-ham is not instigating a transmission by
just turning the package on.

So... It's a little bit messier, but still workable.

Excellent advice.

Scott, can you let me know when you get them in so I can order some of them?
I need trackers for the family vehicles right now and no access to the
settings as they are non hams.
Thanks

Peter Dakota Summerhawk

I've got 5-watt transceivers on the way that'll support an internal
Tracker2. They're still a month or two away, though.

Well, I installed UI-View, before I got the Kantronics Modem, but I do not have UI-View running when I check the different web sites. I do not think I am getting to the repeaters,as it shows [APU25N via TCPIP*,qAC,T2MIDWEST or I do not have the Kantronics KPC-3+ configured correctly. I live some distance away from APRS Repeaters, but I believe I am receiving stations ok, also I am not seeing any stations in UI-View, without connecting to the Server. Thanks

From: Peter Dakota Summerhawk
Topic: 5309 Message: 5338

Peter Dakota Summerhawk

I have one of the Elcom TNC and I need to connect it to a Kenwood TH-G71 that I want to use for APRS in a portable mode. The question is: the TNC had a 4 pin port on the TNC and I need to find a source for getting them so I can order them to wire the Kenwood to the TNC I will upload a pic to the files section of the cable that I got with the TNC so you good folks can see what it looks like.

Thanks
Peter Dakota Summerhawk-N0WRE

5339. WinAPRS not copying

Topic: 5339 Message: 5339

Hi there gang,
Ok here is a good one,time to time I switch beetwen UI-VIEW and WinAPRS.Last time I shut down UI-VIEW and startup WinAPRS but no copy of the home stations and no mobil, but I can see DIGIS's, and the raw packets I see that too...besides - monitor on- what other suggestion I can follow?

I only see DIGIS's on map, but no home stations and no mobil stations,and the raw packet I can see those too.. I think UI-VIEW is messing up my KPC-3+

JOSE/KP3T Best regards to you all

5340. 2008 ARRL/TAPR DCC (Digital Communications Conference), September 26 - 28

Yahoo group: APRS (2007 — 2010)

From: Mark Thompson
Topic: 5340 Message: 5340

ARRL/TAPR DCC (Digital Communications Conference),
September 26 - 28, 2008, Chicago, IL

More Information about the DCC at: http://www.tapr.org/dcc.html
Mark your calendar and start making plans to attend the premier technical conference of the year, the 27th Annual ARRL and TAPR Digital Communications Conference to be held September 26-28, 2008, in Chicago, Illinois. The conference location is the Holiday Inn Hotel, Elk Grove Village IL
The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs to meet, publish their work, and present new ideas and techniques. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications.
Topics include, but are not limited to:
Software defined radio (SDR), digital voice (D-Star, P25, WinDRM, FDMDV, G4GUO), digital satellite communications, Global Position System (GPS), precision timing, Automatic Position Reporting System® (APRS), short messaging (a mode of APRS), Digital Signal Processing (DSP), HF digital modes, Internet interoperability with amateur radio networks, spread spectrum, IEEE 802.11 and other Part 15 license-exempt systems adaptable for Amateur Radio, using TCP/IP networking over amateur radio, mesh and peer to peer wireless networking, emergency and Homeland Defense backup digital communications, using Linux in amateur radio, updates on AX.25 and other wireless networking protocols.

Three-Day Conference
(Friday, Saturday, Sunday)
Technical and introductory sessions will be presented all day Friday and Saturday.
Friday Evening Social. Join others at the conference for a Friday evening social get together.

Saturday Evening Banquet with an invited speaker that concludes with award presentations and prize drawing.

The ever-popular Sunday Seminar that focuses on a topic and provides an in-depth four-hour presentation by an expert in the field.

Technical Sessions

This is a must attend conference for technically inclined amateurs. Now, more than ever, amateur radio needs this great meeting of the minds to demonstrate a continued need for our current frequency allocations by pushing forward and documenting our achievements. The ARRL and TAPR Digital Communications Conference is the best way to record our accomplishments and challenge each other to do more.
Just review past DCC proceedings to the see the depth of topics presented since 1981.

Introductory Sessions

The ARRL and TAPR Digital Communications Conference is for all levels of technical experience, not just for the expert. Not only is the conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any aspect of amateur digital electronics and communications.
Introductory sessions are scheduled throughout the conference to introduce new technical topics for beginners and experts alike. Here are some of the introductory seminars scheduled:

Banquet Speaker

Each year the conferences invites top amateurs in the field to speak. Past speakers have included Geoff Baehr, N6LXA, Chief Network Officer of Sun Microsystems, Dale Hatfield, W0IFO, Chief of the FCC's Office of Engineering and Technology, Yutaka Sakurai, JF1LZQ, Vice President of Japan's Packet Radio User's Group, and Ken Kaplan, N0GZ, who wrote the OS/9 operating system.

Sunday Seminar
  Software Radio Through the Looking-Glass
Phil Harman, VK6APH
One of the most exciting, and rapidly evolving, aspects of Ham Radio is that of Software Defined Radios. What was initially left to technical minded experimenters is now starting to move into the main stream. The latest SDRs offer performance equal to the best analogue radios on the market.
For those brought up on analogue radios there is quite a learning curve to understand exactly how these new radios work, what they do well and what shortcomings they have.
Phil will guide us through the basics of SDRs right up to the very latest techniques that digitise signals directly at the antenna socket. Using diagrams and a minimum of math he will cover such subjects as front end design, mixers, why we need I and Q signals, digital up and down conversion, AGC techniques, noise blanking and high efficiency Power Amplifiers.

Demonstration Room
Each year at the DCC a separate (and lockable) room is provided for people to bring and show off their latest projects. Tables and power will be provided. Bring your equipment and display for all to see, learn, and ask questions about. Be sure to bring a small sign and/or flyer naming and describing your project.

Hotel
Conference presentations, meetings, and seminars will be held at the Holiday Inn Hotel Elk Grove Village, IL.
It is highly recommendedthat you book your room prior to arriving.
A block of rooms at the special DCC room rate of $89.00 single/double.
This special rate is good until September 7, 2008or until the block of rooms are all sold out.

To book your room, call the hotel directly (phone numbers below) and mention the group code TAPR DCC when making reservations.
Be sure to book your rooms early!
Holiday Inn Hotel Elk Grove Village
1000 Busse Road
Elk Grove Village, IL 60007
Phone: (847) 437-6010
Fax: (847) 806-9369
Internet: http://www.hielkgrove.com

Transportation
The nearest airport is the Chicago O'Hare International Airport (ORD). The Holiday Inn Hotel Elk Grove Village provides a complimentary airport shuttle service. Contact the hotel front desk for availability and scheduling.

Call for Papers
Technical papers are solicited for presentation at the 27th Annual ARRL and TAPR Digital Communications Conference to be held September 26-28, 2008 in Chicago, Illinois and publication in the Conference Proceedings. Annual conference proceedings are published by the ARRL. Presentation at the conference is not required for publication.
Submission of papers are due by July 31st, 2008 and should be submitted to:
Maty Weinberg, ARRL
225 Main Street
Newington, CT 06111
or via the Internet to maty@...

Details on Call for Papers

Technical papers are solicited for presentation at the ARRL and TAPR Digital Communications Conference for publication in the Conference Proceedings.
Annual conference proceedings are published by the ARRL. Presentation at the conference is not required for publication.
The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs to meet, publish their work, and present new ideas and techniques. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. Topics include, but are not limited to:
* Software defined radio (SDR)
* Digital voice (D-Star, P25, WinDRM, FDMDV, DRMDV, G4GUO)
* Digital satellite communications
* Global position system
* Precise Timing
* Automatic Position Reporting System (APRS)
* Short messaging (a mode of APRS)
* Digital Signal Processing (DSP)
* HF digital modes

* Internet interoperability with Amateur Radio networks
* Spread spectrum
* IEEE 802.11 and other Part 15 license-exempt systems adaptable for Amateur Radio
* Using TCP/IP networking over Amateur Radio
* Mesh and peer to peer wireless networking
* Emergency and Homeland Defense backup digital communications in Amateur Radio
* Updates on AX.25 and other wireless networking protocols
* Topics that advanced the amateur radio art

I don't see the picture of the connector in the files section. I
would try buxcomm.com. They carry just about any connector you need.
They also have wiring diagrams for wiring various tnc's to radios.

Where? I didn't see a callsign or location in your message so don't
know if you're in U.S./Canada or elsewhere in the world.

Dave,
Sorry about that I sent it as an attachment and it got dropped, its in the photo section now if you want to look. I was thinking that Mouser might have what I need but if there is a better source then I am all ears.

Thanks

Peter Dakota Summerhawk

I don't see the picture of the connector in the files section. I would try buxcomm.com. They carry just about any connector you need. They also have wiring diagrams for wiring various tnc's to radios.

Great! As I recall (I don't run it) UI-View requires the TOCALL as
well as the path as ONE setting in the GUI, which is different than
most other software packages. Someone correct me if I'm wrong, but
for UI-View I think you'd fill in:

"APRS,WIDE1-1,WIDE2-1" for a mobile
or
"APRS,WIDE2-2" for a fixed station

For any other software package you'd use "WIDE1-1,WIDE2-1" or
"WIDE2-2" because the TOCALL is a separate field, most often
automatically set by the software.

Peter,

I can't tell, is the plug 1/8" (3.5mm) or 3/32" (2.5mm).

Regardless, I have access to both connectors.

Ted,

Curt's suggesting is correct. Unfortunately there aren't many digipeaters in your area so don't be surprised if you don't get digipeated right away. There are several in all directions 35-50 miles away, though, so if you're mobile you may get a lucky packet out to the rest of the network while hill-topping. You will of course have better luck with a home station since you'll most likely have a much higher antenna.

If you can install a digipeater in that area it would help. I would like to put a full digipeater up in the Garnett, KS, area to cover the Prairie Spirit Rail Trail. (If you happen to have any leads for possible digipeater sites in that area, I'd be interested in hearing about them. The ham club in Garnett seems to be dormant.)

Thanks for the reply, I think I have my station digipeated now, I
don't know how to tell if it is digipeating, I have a dedicated
radio, and antenna about 35ft high, at the moment, I plan to put it on
a 80ft tower in the near future. I am currently working on the tower. Ted

Date: 2008-06-15 14:14:52 UTC
From: ltdoc
Topic: 5359 Message: 5359

I've been presented with a TNC (Kan '9612') a radio (IC-228) and am told we will have a computer available 'later'. And I've been asked to set up a digipeater for APRS for the local club and EOC (why ME, Lord?). I'm familiar with using a software 'TNC' and doing APRS tracking with a laptop, but NOT using a TNC, etc, as given. So, any suggestions (other than doing something anatomically impossible with the gear) would be greatly appreciated!
For what it's worth, I've seen (copied it!) a command list for a KPC-3 used in a similar set up. Just no idea what would carry over to the '9612' TNC, or what some of that 'stuff' actually is. And naturally, no manual for the '9612'. I think I can get around that part, maybe.

Topic: 5327 Message: 5360

Bill,
For what it's worth, I use a hand-held scanner for the receiver, connected to the laptop, and an antenna naturally. It works just fine for fairly local stuff, not so fine for any distance, which is a matter of antenna more than anything else. I've used it once on a 100 foot high antenna NOT cut for 2 meters and was very surprised at the coverage!
Not optimized for digital stuff, does have a couple of knobs to twiddle with occasionally (vol/sql), but is a 'small' package. The scanner is one of the 'older' Radio Shack thingys.
Paul / W5LZ

5362. GPS APRS Newbie

Yahoo group: APRS (2007 — 2010)
Date: 2008-06-23 12:11:22 UTC
From: thwitherspoon
Topic: 5362 Message: 5362

Hi, Group,

I know this is a reasonably common topic, but I've searched through the group archives and cannot find an answer to my specific question.

I am searching for an inexpensive GPS that will work with APRS (one with a serial port, I reckon?). I don't know if this is even possible, but I'd like to get one new or used for approx $100 or less. If it works with APRS, has a reasonably sensitive receiver (so that it'll work okay in wooded areas) and is somewhat rugged, that's all I'll need.

I don't really need maps etc. since this will not be used for driving (but if it has some that's okay too).

I've been looking at the Garmin eTrex H on Amazon. It looks like a reasonably sensitive unit, but I can't tell if it'll work with APRS stuff.

Any info/thoughts/advice you can share will be much appreciated!

Cheers,
Tom

I have been using my Garmin eTrex for a long time now, it has been subjected to summers in phoenix with 118 temps locked inside of a black truck for years, it has been off road and beaten to death. The LCD screen is a little messed up and it looks like it has been thru a war zone, but like a Timex it has takin a lickin and still keeps on tickin. I bought mine for 99 bucks over 5 years ago if I remember right, it is still wired to the Yaesu 2600 and a Tiny Trak 2 inside the suitcase tracker as it was named.
.
The truck is gone but the tracker lives on, here are some pix from 3 years ago. http://www.kb7tbt.com/pix/aprspix/

If I am right the eTrex is down to 89 bucks now, I say it is well worth the money if you are not looking for all the fancy stuff.

Someone recommended an Etrex: I seem to remember mention of a
low-end unit that had no serial interface, so be careful there.
Make sure you can get a power/data cable for it that will output
serial NMEA data (not USB serial). Garmin charges a premium for
these cables by the way, something like $30?. Factor that into your
total cost. There are inexpensive options for cables (Purple
Computing? connectors).

You mentioned wooded areas: Get one of the Garmins with the
high-sensitivity chipset: These have the SiRFStar-III chipset
(non-Garmin) which works _much_ better than the Garmin chipset under
low-signal conditions.

If you can afford one of the models with it, buy it. The last time
I looked at the site they were putting that chipset on some
higher-end units, but hopefully it's starting to appear in lower-end
units by now. See the Garmin.com site to see which models have
that. It's really worth it under the trees.

Check out the Byonics GPS2 for $69

It has the SiRF III chipset which I'm told is the latest and greatest.

http://www.byonics.com/tinytrak/gps.php

Byonics GPS2
The GPS2 is more sensitive than the GPS1, draws less current, and is
built with the SiRFstar III chipset. It has the same DB-9 connector
as the GPS1. It features Wide Area Augmentation System (WAAS) to
provide unmatched accuracy and performance. It has an on-board
rechargeable battery for fast satellite acquisition during power-up,
and requires 5V to operate. Tracking up to 20 satellites, the Byonics
GPS2 can be used with almost every major mapping software (NMEA 0183
v2.2 data protocol).
The GPS2 unit comes with an internal magnet for versatile mounting
options, and is water resistant.
It draws 65mA typically, and will work to an altitude of 18 km and
speed of 515 km/h. Weight is 3.6oz. See below for more stats.

This is a 5 volt GPS. Do not connect this GPS to 12 volts or it will
be destroyed. If using with a TinyTrak3Plus, configure J7 for 5 volts
(the bottom two square pads soldered together).

He didn't say whether he wanted a hocky-puck style or something he
could use handheld. For hocky-puck style (good for trackers), here
are some more possibilities: Be careful of the input voltages, some
want 5V, some can handle car voltages:

For which bit of software?

Some software has a code which allows you to save your
configuration. You obtain from the software maintainer(s). Usually
by sending them money. One of them asks (nicely) for a donation to
cancer research but the code itself is free.

There's a separate code for logging into the APRS-IS servers, which
is freely obtainable and the algorithm for doing so has been
published. I can generate one of those for you from your callsign
if you wish. Say the word.

Some software skips the first code altogether and only requires the
second code, so it's fully functional from the get-go as far as
saving settings. "Xastir" is in this camp, under GPL license and
therefore free for the download.

5371. Questions about setting up a wide digi

Yahoo group: APRS (2007 — 2010)
Date: 2008-06-24 14:47:21 UTC
From: bp_gay
Topic: 5371 Message: 5371

Hi group,
Our club will soon be setting up a wide digi, and I have a couple questions.

1. Do I need to setup the state path (SSn-n)? I live in North Florida and do not know if it would be for the entire state or just the NFL section. How could I find out? Do you normally setup the state path?

2. What are the beacon/ID requirements for a digi? Do I need to send out a beacon every 10 minutes? I will be doing callsign substitution.

Thanks,
Brent, KF4JZY

From: wolobmp
Topic: 5376 Message: 5376

Hello all. I have a question about gps and APRS. I run a Kenwood TH-D700 mobile and like to know if there is any reasonable cost color gps units that work with aprs? I had another gsp unit that costed over $600 and just wasnt all that great. I'm not interested in having callsigns show up on my gps unit, but more interested in a good quality sensbile priced gps unit that can be used for aprs and getting directions. Thats for your suggestions...oh 1 more thing, I was using a Garmin GPS-V that worked ok but screen was too small plus not in color. So I'll wait for your suggestions...Thanks 73 Mike

5377. APRS via IC-706

Yahoo group: APRS (2007 — 2010)
Date: 2008-06-25 03:15:01 UTC
From: Bob MacDonnell
Topic: 5377 Message: 5377

Hello from Calgary;
Does anyone out there use an ICOM 706 for APRS? I bought a used 706 on eBay a few months ago to use in North America land mobile. I'm not even sure what model it is, but expect it is near original. At least not a MkII. S/N is 11832, but I think all that is irrelevant.

What I'm trying to do is APRS via the 706 using an OpenTracker+ which is also new to me. I've used a TinyTrak3 with a Kenwood TS-50 successfully before but the ICOM is new to me. I have an old IC-735 that is a maritime mobile backup, but it's a different animal.

I've been trying to use the RTTY stereo jack input for the OT+ o/p and there is no modulation on the transmitted signal. I suspect I'll have to open up the 13 pin DIN connector I put on a cable for my Pactor for running Airmail/Winlink and bring out the audio input from pin 11, but I thought I'd check first to see if I'm on the right track.

I haven't figured out yet why the components get smaller as my eyes get weaker!

Thanks in advance for any input, whether confirmation or denial!

Bob,

Check the back of the 706, you should find a 6 pin
Mini-Din connector. This is the packet port for both
1200 and 9600 baid packet. This is the best and
easiest way to interface the OpenTracker to the 706.
If you have the manual, there should be a pinout for
the port. If not, google "mini-din packet port" and
you should find the pinout, since this is now the
amateur industry standard.

It sounds like you are competent to build the cable
yourself, but if you get frustrated and wish to buy
somthing, we offer this cable with the 6 pin Mini-Din
plug. Just drop by our cables page at:

I use (among other units) a GPSMAP 276C. It has a serial port for NMEA
communications with e.g. a TH-D7 or TM-D700/710 (or with the NMEA
network in a boat), and a USB port for map and software exchange with
a computer.

Hi, Group,

Thanks for all of your suggestions and help. I think I'll go the way of the serial port gps--probably the Byonics GPS2. I like the idea of a high sensitivity receiver and something I'll use specifically with APRS. I may get a hand unit separately.

I'm so amazed how GPS pricing has dropped over the past few years.

Again, thanks to all!

Cheers,
Tom

From: Bob MacDonnell
Topic: 5377 Message: 5381

Hi Jason;
Sorry, no mini DIN 6 pin on the IC-706. Maybe they have them on the newer versions of the 706, but not on this one.

This model uses a 13 pin DIN jack which I have not seen elsewhere. I bought a mating plug from the ICOM dealer in Vancouver a few weeks ago. Shudda got two!

The radio also has a couple of 1/8" stereo phone jacks for RTTY and remote control. I have tried using the RTTY audio input, but suspect now it is only going to work for digital inputs, not audio.

I did look at your RTrac, but opted for OT+ on a retiree's income. ;-)

But thanks for trying. It's appreciated. Maybe someone out there is actually more familiar with the 706 and knows the internal wiring. This one came w/o a manual so I'm using a MkII manual from dkmods.

Date: 2008-07-03 09:19:24 UTC
From: nrhlinux
Topic: 5388 Message: 5388

Greetings,

I know if you add the D*STAR module in the 2820 it comes with a GPS unit. I've also read this allows APRS ability.

Do you know to what extent this will work?

I've already got a TinyTrack unit sending my location. I would like to be able to send people messages and see other peoples location and direction however.

Does the 2820 just do transmit or can it show positions and handle messaging too?

From what I'm told, it gives you GPS position information over APRS
only. It doesn't do the digital (packet) stuff that normal APRS gives
you. But that's just what I'm told.

Thanks for the info. Seems this would just tie up the secondary receiver. I think I'll keep my secondary APRS radio for duty. Thanks!

Check out http://www.rxcomm.net/. I've built one but have not deployed it yet. It has a built in TNC, so just connect it to a radio. The only negative is it does not support a rain gauge at this time, though there is a connector port for one. On board is a pressure sensor, humidity and temperature sensor. It supports the "one wire" wind sensor.

5393. Igate receives differently

Yahoo group: APRS (2007 — 2010)
Date: 2008-07-06 06:35:25 UTC
From: Paul Lee
Topic: 5393 Message: 5393

I have an igate setup (KC0WIF-1) with UI-VIEW32 software, TNC-X and iCom-V8. It works but seems to detect differently different trackers. I have two trackers: one is Kenwood TH-D7A and another one is Bionics TinyTrack 3 based. The Kenwood unit is detected by my iGate about every time it transmits but the TinyTrack comes through only about every third time. I can get other digis catching my TinyTrack OK or another igate catching it directly with no problem.

Anybody has ideas what the problem is? Is there some UI-VIEW32 software setting I need to change? Or what?

5394. Any changes to Palm Beach, Florida?

Yahoo group: APRS (2007 — 2010)
Date: 2008-07-06 11:46:03 UTC
From: Scott Heath
Topic: 5394 Message: 5394

Is one of the digipeaters down in Palm Beach County, Florida (USA)? I seem to be getting no activity on 144.39 mHz (all of a sudden) and I can't seem to get "into" the system for a "MY POSITION" indication on a D-710A. This is occurring on 3 seperate APRS systems so I know it's not just a "bad" antenna or something.
Thank you very much!!

I had a similar problem with the Elcom tracker that I was using. Is there a setting for TX delay? I had to set mine from 45 ms to about 100 to make sure that the digis in the area were awake to pick up the sugnal.

This is a bit cool. I have managed to put a cut down version of Win XP on the 2 gig drive of my Asus 2G. I then installed APRSPoint, Map point and streets and Trips on a 4 gig SD card. I run it with a TH-D7 and Garmin Etrex. The darn thing works. The only down sides are all the cables needed to connect it all and battery life. I'm going to attempt to shorten some of the cables if possible.

If you try this, remember to turn OFF the auto update function. It will kill your meager drive in a hurry.

I'm leaving for Germany and Switzerland the 15th of this month and hope to have quite a bit of fun. I understand they use 144.8 for aprs.

Date: 2008-07-08 11:16:06 UTC
From: Kim Wells
Topic: 5397 Message: 5397

Hello to the group.

My D710 is not "completely" Auto-Tuning to an APRS Repeater Frequency Object.
Is it the radio or is it a bad transmitted object string?

The object can be found here:
""http://www.findu.com/cgi-bin/find.cgi?call=447.725-""
Everything except the repeater shift is being set; receive frequency
& tone are correct.

Interestingly, this link
""http://www.findu.com/cgi-bin/find.cgi?call=146.805-""
Provides the proper frequency and shift, but not the tone.

I have been reviewing the following links:
""http://www.ew.usna.edu/~bruninga/localinfo.html""
""http://www.ew.usna.edu/~bruninga/aprs/freqspec.txt""

Thanks & 73,

It is time again to hit the keys and write for TAPR's quarterly
newsletter, Packet Status Register (PSR), as the deadline of the Digital Communcations Conference (DCC) issue of PSR fast approaches. You can write about SDR or APRS or LSMFT or anything with or without initials, as long as it is related to ham radio, preferably on the digital side of the hobby.

And remember, besides the glory of having your work appear in PSR, your TAPR membership will be automatically extended by three months.

Write early and write often!

I believe the shift is not extracted from the string but rather it is assumed that the radio will used standard shifts. The shift may not even appear in the object text. For example, 147.315KS is a valid object name for a repeater.

> Interestingly, this link
> ""http://www.findu.com/cgi-bin/find.cgi?call=146.805-""
> Provides the proper frequency and shift, but not the tone.

Unfortunately this is something that you'll see way too often -- an object string with errors. In this case the tone data is not formatted correctly. The only thing that could be done is send a nice e-mail to the station operator (W2KP) and see if he'll correct it. There is another problem with this particular object: the packet appears to have been sent with a path of WIDE1-1,WIDE2-2. Repeater objects need to be sent with no path since, in most (nearly all) cases, the repeater can't even be heard by any stations that are two or three APRS digi hops away.

OK. Finally found whats bugging my iGate - the squelch level.
Contacted John Hansen of Coastal ChipWorks (http://www.TNC-X.com)
who told me to just open the squelch fully on. Now my iGate picks up
almost every tx from my APRS tracker.

The tracker had 200ms TX delay which is normally plenty. But the
squelch created a larger delay need.

5404. Question for trackers-Path related

Yahoo group: APRS (2007 — 2010)
Date: 2008-07-25 04:21:53 UTC
From: Peter Dakota Summerhawk
Topic: 5404 Message: 5404

I have been playing with the idea with our EC for using trackers and a portable digi. But my question is: Can we set up the trackers for Wide1-1 or Wide2-2 and have a TNC that is set up as a tracker relay that signal to the command vehicle? I have a TM-271 with a tracker installed but will it relay the signal for the trackers? That way we don't have to have a separate TNC for relay.

Thanks for the information in advance!

Hi Peter,

Depends on the tracker. A Tracker2 (OT2m or T2-135) will do it (and be
a weather station and KISS TNC at the same time, if you want) and you
could do it with a KPC-3+, but I don't like the KPC-3+ as a tracker.
It's expensive and doesn't make a good tracker.

Scott,
Been looking at the OT2m for the car can you explain how to interface with a TM-271 with the data cable out the back? The reason I ask is that what we are looking for is someone (such as myself) to be in position to track and relay the data coming from the pocket trackers. I have been looking for a TNC or tracker that I can do this with WITHOUT changing the settings on the tracker. Elcom makes a TNC but you have to upload the firmware from tracker to TNC with a digi setting and then back again. It's a pain in the rear to say the least. If the OT2m can do this then I am going to order one! The 271 is a data dedicated radio strictly for APRS tracker. So we are wanting to have a digi (or something that can relay the signal) from the trackers back to the CP mobile rig.
I hope I am intelligible in this email as I have been working 16 hours straight and am dog tired.
Thanks

Peter Dakota Summerhawk

If you've added the data cable (it's shown on my website at n1vg.net)
it's pretty easy to hook up. RPC Electronics (www.rpc-electronics.com)
probably has stock cables for the 6-pin mini-DIN. Or you could just
skip the mini-DIN entirely and wire it up to a DB9 for the OT2m. You
should probably use the '9600' output, since it's not de-emphasized and
helps the demodulator tolerate bad signals better.

As for configuration, you'll just need to set the alias(es) you want and
enable them to get it digipeating. It'll still track as usual.

The bad news is that the OT2m is backordered, waiting for enclosures.
The enclosures came in today, but they screwed up the rear panels and
they'll need to be redone. I've got enough of the panels left from the
last batch to ship maybe half of my backorders. Hopefully I'll have
replacements next week.

5408. APRS on Trains

Yahoo group: APRS (2007 — 2010)
Date: 2008-07-26 15:01:44 UTC
From: phil_shelton2000
Topic: 5408 Message: 5408

My idea of operating APRS from trains in Germany and Switzerland turned out to be a bust. Apparently the windows are made from glass containing some material that blocks the signals from GPS Sats. I tried several arrangements and two GPS recievers and none would aquire a Sat. I tried from one of the windows in an entrance door and recieved strong signals but I couldn't set up there of course. I did get good locks and signals from the hotel in Basel. I showed 19 stations at one time and my signal showed up on findu.com. I had a good lock but no signals in Munich. The Asus Eeepc, with windows, Th-D7 and my USB GPS worked well.

Oh well, another day another project.

Hi Phil,

Thanks for the report.

I have had luck on airplanes by holding the GPS up to the window or even letting it rest on the arm of the seat tilting up toward the window but have not tried to use it on a train.

It is good to know that the Asus Eeepc worked well for you. I have been interested in getting one. The idea of an all solid state system (no conventional hard disk spinning) seems very attractive to me for 24/7/365 hamming.

Subject: [APRS] APRS on Trains

My idea of operating APRS from trains in Germany and Switzerland turned out to be a bust. Apparently the windows are made from glass containing some material that blocks the signals from GPS Sats. I tried several arrangements and two GPS recievers and none would aquire a Sat. I tried from one of the windows in an entrance door and recieved strong signals but I couldn't set up there of course. I did get good locks and signals from the hotel in Basel. I showed 19 stations at one time and my signal showed up on findu.com. I had a good lock but no signals in Munich. The Asus Eeepc, with windows, Th-D7 and my USB GPS worked well.

Oh well, another day another project.

I too have used GPS receivers on planes and had good luck holding the unit to the window. Being a private pilot, I like to follow a flights progress. It can get interesting. Coming back from Munich Thursday on a Delta flight the Steward was admiring the EeePC and my tracking the aircraft. He came back later and told me GPS receivers were not allowed to be operated in flight. I wanted to ask if the pilots were going to turn theirs off, glad they didn't, because they were using at least two. I thought better and kept my mouth closed and just shut everything down. I found nothing about it in the literature.

I have had the flight attendants express interest but never ask me to shut my GPS down. On the other hand, most of my recent flying has been domestic.

Matter of fact, I had more "dirty looks" on cruise ships in the early days of GPS then I had on airliners!

Just listening with a broad band detector will show that the R.F. "noise" coming from a garden variety laptop can be significant but the R.F. coming from the local oscillator on a GPS is probably going to be minimal in comparison. (Matter of fact, I could never understand why the FCC was so "relaxed" when it came to passing computer equipment versus their attention to R.F. noise from other equipment.)

But the airlines permit laptops and get flustered when it comes to GPS's??

Oh well.

Yes it's funny they won't let you use a GPS receiver but they'll let you use
a WIFI transceiver if you pay the $30 fee to get on the planes WIFI network.

I've heard stories of mutual interference between GPS receivers. I think I've seen it once myself, in fact, but I couldn't prove it. On a SAR call, six of us with handheld GPS receivers climbed into a Huey for a ride to the crash site, and the panel-mount GPS receiver stopped working. There wasn't an opportunity to sort it out in flight, and the pilot navigated to the LZ using a $99 yellow eTrex.

I think allowing other electronics was mostly a matter of keeping the passengers from revolting. They can live without GPS receivers, but they're going to be unhappy giving up laptops and MP3 players.

I literally flew back home today to SW MO from Orlando and I had my little yellow Garmin eTrex with me. It managed to get a lock on anywhere from 3 to 8 satellites just by holding it against the window. And right, Ed, the plane did not crash. :-) It was kind of fun tracking down and back, but now I need to get a bigger one in COLOR! :-)

Oh, BTW, this was the "charter" airline Allegiance Air, with major hubs in Sanford, FL, and Las Vegas.

Unfortunately what you can and can't use in the air is entirely up to the flight crew regardless of the rules.

For example, in Delta's own in-flight rules printed in Sky Magazine on the plane and also on their website, GPS receivers are permitted at the gate, during taxiing to the gate after landing, and when at cruising altitude. However, the flight crew has the last word and so it'll depend on their mood whether you get to use it or not.

With
a little pre-planning you can send APRS reports, glass or no glass.
Train stations don't move very far, so create a file with the APRS
Strings for each station you'll pass through. When you arrive, just
copy the proper line from the file, and send through the radio. No GPS
required. Yeah, I know. That takes most of the fun out of it.

Southwest used to allow GPS use, but not anymore. Also not allowed on
American flights.

A dual gateway with one KAM ? Is it hooked up to both a HF and VHF radio?

Otherwise, try rebooting the PC?

It's most certainly the sunscreen coating, just as many car models
have on their windscreens.
Maybe you'll have to stand on the passage between two carriages; the
rubber roof there might be signal friendlier, hi.

Scott,
Ok so I take it there some software that needs to be configured for this? And if you wire the OTM2 to the 9600 will it still TX for 1200 baud? I think direct wire is the best as its going to be a data related radio tracker/digi anyways. Question on the GPS, I was planning on running 12VDC on it, would that harm the GPS? I don't want to go frying the GPS right off the start. Let me know and I hope that the cases you ordered some in.
Thanks
Peter Dakota Summerhawk

Subject: Re: [APRS] Question for trackers-Path related

If you've added the data cable (it's shown on my website at n1vg.net)
it's pretty easy to hook up. RPC Electronics (www.rpc-electronics.com)
probably has stock cables for the 6-pin mini-DIN. Or you could just
skip the mini-DIN entirely and wire it up to a DB9 for the OT2m. You
should probably use the '9600' output, since it's not de-emphasized and
helps the demodulator tolerate bad signals better.

As for configuration, you'll just need to set the alias(es) you want and
enable them to get it digipeating. It'll still track as usual.

The bad news is that the OT2m is backordered, waiting for enclosures.
The enclosures came in today, but they screwed up the rear panels and
they'll need to be redone. I've got enough of the panels left from the
last batch to ship maybe half of my backorders. Hopefully I'll have
replacements next week.

Topic: 5404 Message: 5425

The Tracker2 itself will have to be configured initially, either through
the config program or the command console.

The '9600' and '1200' outputs are just audio, not data. The '1200' is
probably de-emphasized and AC coupled, pretty much like an unsquelched
speaker output. The '9600' output is flat and DC coupled.

Which GPS do you want to run at 12 volts? The ADS-GM1 takes 5 volts and
WILL die if you feed it 12, but you don't need to worry about it with
the OT2m - it'll get 5 volts from the OT2m's internal regulator.

I'll be calling the enclosure supplier this morning (again) about fixing
the rear panels.

Scott,
Was looking at putting the OTM2 in the car as tracker and digi so I will need a GPS to run it with as well. So will the software for the OT2m work that way? Maybe I am misunderstanding something here I am currently running a uTNT but the issues with firmware have plagued me from the get go and I am really unhappy with the unit as its not what I was told it would be. I would be much happier if the OT2m will track in Smart beacon mode as well as digi the signals that we need.
Let me know on this?
Thanks,

Peter Dakota Summerhawk-N0WRE

The Tracker2 itself will have to be configured initially, either through the config program or the command console.
